# OpenMx Reference Manual 

June 5, 2015
Date 2015-05-26
Title Extended Structural Equation Modelling
URL http://openmx.psyc.virginia.edu
BugReports http://openmx.psyc.virginia.edu/forums
Description Facilitates treatment of statistical model specifications
as things that can be generated and manipulated programmatically.
Structural equation models may be specified with reticular action model matri-
ces or paths,linear structural relations matrices or paths, or directly in matrix algebra.
Fit functions include full information maximum likelihood,maximum likeli-
hood, and weighted least squares.
Example models include confirmatory factor, multiple group, mixture
distribution, categorical threshold, modern test theory, differential equations, state space, and many others.

BaseCompute-class BaseCompute

## Description

This is an internal class and should not be used directly.

## See Also

$m x$ ComputeEM, mxComputeGradientDescent, mxComputeHessianQuality, mxComputeIterate, mxComputeNewtonRaphson, mxComputeNumericDeriv

Bollen Bollen Data on Industrialization and Political Democracy

## Description

Data set used in some of OpenMx's examples, for instance WLS. The data were reported in Bollen (1989, p. 428, Table 9.4) This set includes data from 75 developing countries each assessed on four measures of democracy measured twice (1960 and 1965), and three measures of industrialization measured once (1960).

## Usage

data("Bollen")

## Format

A data frame with 75 observations on the following 11 numeric variables.
y1 Freedom of the press, 1960
y2 Freedom of political opposition, 1960
y3 Fairness of elections, 1960
y4 Effectiveness of elected legislature, 1960
y5 Freedom of the press, 1965
y6 Freedom of political opposition, 1965
y7 Fairness of elections, 1965
y8 Effectiveness of elected legislature, 1965
x1 GNP per capita, 1960
x2 Energy consumption per capita, 1960
x3 Percentage of labor force in industry, 1960

## Details

Variables y1-y4 and y5-y8 are typically used as indicators of the latent trait of "political democracy" in 1960 and 1965 respectively. x1-x3 are used as indicators of industrialization (1960).

## Source

The sem package (in turn, via pers. comm Bollen to Fox)

## References

## Examples

```
data(Bollen)
str(Bollen)
plot(y1 ~ y2, data = Bollen)
```

cvectorize Vectorize By Column

## Description

This function returns the vectorization of an input matrix in a column by column traversal of the matrix. The output is returned as a column vector.

## Usage

cvectorize(x)

## Arguments

x an input matrix.

## See Also

rvectorize, vech, vechs

## Examples

```
cvectorize(matrix(1:9, 3, 3))
cvectorize(matrix(1:12, 3, 4))
```

## Description

Data set used in some of OpenMx's examples.

## Usage

data("demoOneFactor")

## Format

A data frame with 500 observations on the following 5 numeric variables.
x1
x2
x3
x4
x5

## Details

Variables $\mathrm{x} 1-\mathrm{x} 5$ are typically used as indicators of the latent trait.

## Source

Simulated.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## Examples

```
data(demoOneFactor)
cov(demoOneFactor)
cor(demoOneFactor)
```

demoTwoFactor Demonstration data for a two factor model

## Description

Data set used in some of OpenMx's examples.

## Usage

data("demoTwoFactor")

## Format

A data frame with 500 observations on the following 10 numeric variables.
x 1
$x 2$
x3
$\times 4$
x5
y1
y2
y3
y4
y5

## Details

Variables $\mathrm{x} 1-\mathrm{x} 5$ are typically used as indicators of one latent trait. Variables y1-y5 are typically used as indicators of another latent trait.

## Source

Simulated.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## Examples

```
data(demoTwoFactor)
cov(demoTwoFactor)
cor(demoTwoFactor)
```

diag2vec Extract Diagonal of a Matrix

## Description

Given an input matrix, diag2vec returns a column vector of the elements along the diagonal.

## Usage

```
diag2vec(x)
```

## Arguments

$x \quad$ an input matrix.

## Details

Similar to the function diag, except that the input argument is always treated as a matrix (i.e., it doesn't have diag()'s functions of returning an Identity matrix from an nrow specification, nor to return a matrix wrapped around a diagonal if provided with a vector). To get vector 2 matrix functionality, call vec2diag.

## See Also

```
vec2diag
```

## Examples

```
diag2vec(matrix(1:9, nrow=3))
# [,1]
# [1,] 1
# [2,] 5
# [3,] 9
diag2vec(matrix(1:12, nrow=3, ncol=4))
# [,1]
# [1,] 1
# [2,] 5
# [3,] 9
```

## dzfData DZ female data

## Description

Data for extended twin example ETC88.R

## Usage

data("dzfData")

## Format

A data frame with 2007 observations on the following 37 variables.

eigenvec Eigenvector/Eigenvalue Decomposition

## Description

eigenval computes the real parts of the eigenvalues of a square matrix. eigenvec computes the real parts of the eigenvectors of a square matrix. ieigenval computes the imaginary parts of the eigenvalues of a square matrix. ieigenvec computes the imaginary parts of the eigenvectors of a square matrix. eigenval and ieigenval return nx1 matrices containing the real or imaginary parts of the eigenvalues, sorted in decreasing order of the modulus of the complex eigenvalue. For eigenvalues without an imaginary part, this is equivalent to sorting in decreasing order of the absolute value of the eigenvalue. (See Mod for more info.) eigenvec and ieigenvec return nxn matrices, where each column corresponds to an eigenvector. These are sorted in decreasing order of the modulus of their associated complex eigenvalue.

## Usage

eigenval(x)
eigenvec(x)
ieigenval(x)
ieigenvec(x)

## Arguments

## Details

Eigenvectors returned by eigenvec and ieigenvec are normalized to unit length.

## See Also <br> eigen

## Examples

```
A <- mxMatrix(values = runif(25), nrow = 5, ncol = 5, name = 'A')
G <- mxMatrix(values = c(0, -1, 1, -1), nrow=2, ncol=2, name='G')
model <- mxModel(A, G, name = 'model')
mxEval(eigenvec(A), model)
mxEval(eigenvec(G), model)
mxEval(eigenval(A), model)
mxEval(eigenval(G), model)
mxEval(ieigenvec(A), model)
mxEval(ieigenvec(G), model)
mxEval(ieigenval(A), model)
mxEval(ieigenval(G), model)
```

## Description

Data set used in some of OpenMx's examples.

## Usage

data("example1")

## Format

A data frame with 400 observations on the following variables.
IDNum Twin pair ID
Zygosity Zygosity of the twin pair
X 1 X variable for twin 1
Y1 Y variable for twin 1
X2 X variable for twin 2
Y2 Y variable for twin 2

## Details

Same as example2 but in wide format instead of tall.

## Source

Classic Mx Manual.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## Examples

```
data(example1)
plot(X2 ~ X1, data=example1)
```

## Description

Data set used in some of OpenMx's examples.

## Usage

data("example2")

## Format

A data frame with 800 observations on the following variables.
IDNum ID number
TwinNum Twin ID number
Zygosity Zygosity of the twin
$X X$ variable for twins 1 and 2
Y Y variable for twins 1 and 2

## Details

Same as example1 but in tall format instead of wide.

Source
Classic Mx Manual.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## Examples

```
    data(example2)
    plot(Y ~ X, data=example2)
```

    expm Matrix exponential
    
## Description

Matrix exponential

## Usage

expm(x)

## Arguments

x matrix
factorExample1 Example Factor Analysis Data

## Description

Data set used in some of OpenMx's examples.

## Usage

data("factorExample1")

## Format

A data frame with 500 observations on the following variables.
x1
x2
x3
$\times 4$
$\times 5$
$\times 6$
x7
x8
x9

## Details

This appears to be a three factor model, but perhaps with an odd loading structure.

## Source

Simulated

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## Examples

```
data(factorExample1)
round(cor(factorExample1), 2)
factanal(covmat=cov(factorExample1), factors=3, rotation="promax")
```

factorScaleExample1 Example Factor Analysis Data for Scaling the Model

## Description

Data set used in some of OpenMx's examples.

## Usage

data("factorScaleExample1")

## Format

A data frame with 200 observations on the following variables.
X1
X2
X3
X4
X5
X6
X7
X8
X9
X10
X11
X12

## Details

This appears to be a three factor model with factor 1 loading on $\mathrm{X} 1-\mathrm{X} 4$, factor 2 on $\mathrm{X} 5-\mathrm{X} 8$, and factor 3 on X9-X12.

## Source

Simulated

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## Examples

```
data(factorScaleExample1)
round(cor(factorScaleExample1), 2)
```

factorScaleExample2 Example Factor Analysis Data for Scaling the Model

## Description

Data set used in some of OpenMx's examples.

## Usage

data("factorScaleExample2")

## Format

A data frame with 200 observations on the following variables.
X1
X2
X3
X4
X5
X6
X7
X8
X9
X10
X11
X12

## Details

This appears to be a three factor model with factor 1 loading on X1-X4, factor 2 on $\mathrm{X} 5-\mathrm{X} 8$, and factor 3 on X9-X12. It differs from factorScaleExample1 in the scaling of the varialbes.

## Source

Simulated

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## Examples

```
data(factorScaleExample2)
round(cor(factorScaleExample2), 2)
data(factorScaleExample2)
plot(sapply(factorScaleExample1, var), type='l', ylim=c(0, 6), lwd=3)
lines(1:12, sapply(factorScaleExample2, var), col='blue', lwd=3)
```

```
genericFitDependencies,MxBaseFitFunction-method
    Add dependencies
```

## Description

If there is an expectation, then the fitfunction should always depend on it. Hence, subclasses that implement this method must ignore the passed-in dependencies and use "dependencies <- callNextMethod()" instead.

## Usage

\#\# S4 method for signature 'MxBaseFitFunction'
genericFitDependencies(.Object, flatModel, dependencies)

## Arguments

| .Object | fit function object |
| :--- | :--- |
| flatModel | flat model that lives with .Object |
| dependencies | accumulated dependency relationships |

```
HS.ability.data Holzinger and Swineford (1939) Ability data in 301 children from two
schools
```

## Description

This classic data set contains of intelligence-test scores from 301 children on 26 distinct tests. The data are also available in the MBESS package.
The tests cover mental speed, memory, mathematical-ability, spatial, and verbal ability as listed below.

## Usage

data("HS.ability.data")

## Format

A data frame with 301 observations on the following 2 variables.
id student ID number (int)
Gender Sex (Factor w/ 2 levels "Female","Male"
grade Grade in school (integer 7 or 8 )
agey Age in years (integer)
agem Age in months (integer)
school School attended (Factor w/2 levels "Grant-White" and "Pasteur")
addition A speed test (numeric)
code A speed test (numeric)
counting A speed test (numeric)
straight A speed test (numeric)
wordr A memory subtest
numberr A memory subtest
figurer A memory subtest
object A memory subtest
numberf A memory subtest
figurew A memory subtest
deduct A mathematical subtest
numeric A mathematical subtest
problemr A mathematical subtest
series A mathematical subtest
arithmet A mathematical subtest
visual A spatial subtest

```
cubes A spatial subtest
paper A spatial subtest
flags A spatial subtest
paperrev A spatial subtest
flagssub A spatial subtest
general A verbal subtest
paragrap A verbal subtest
sentence A verbal subtest
wordc A verbal subtest
wordm A verbal subtest
```

## Details

The data are from children who differ in grade (seventh- and eighth-grade) and are nested in one of two schools (Pasteur and Grant-White). You will see it in use elsewhere, both in R (lavaan, MBESS), and in Joreskog (1969) reporting a cfa on the Grant-White school subject subset).

The last two tests are substitute versions for other tests. paperrev (a paper form board test) can substitute for paper and flagssub for the lozenges test flags.

Joreskog, K. G. (1969). A general approach to confirmatory maximum likelihood factor analysis. Psychometrika, 34, 183-202.

## Examples

```
data(HS.ability.data)
str(HS.ability.data)
levels(HS.ability.data$school)
plot(flags ~ flagssub, data = HS.ability.data)
```

## Description

The dependency tracking system ensures that algebra and fitfunctions are not recomputed if their inputs have not changed. Dependency information is computed prior to handing the model off to the optimizer to reduce overhead during optimization.

## Usage

imxAddDependency(source, sink, dependencies)

## Arguments

source a character vector of the names of the computation sources (inputs)
sink the name of the computation sink (output)
dependencies the dependency graph

## Details

Each free parameter keeps track of all the objects that store that free parameter and the transitive closure of all algebras and fit functions that depend on that free parameter. Similarly, each definition variable keeps track of all the objects that store that free parameter and the transitive closure of all the algebras and fit functions that depend on that free parameter. At each iteration of the optimization, when the free parameter values are updated, all of the dependencies of that free parameter are marked as dirty (see omxFitFunction. repopulateFun). After an algebra or fit function is computed, omxMarkClean() is called to to indicate that the algebra or fit function is updated. Similarly, when definition variables are populated in FIML, all of the dependencies of the definition variables are marked as dirty. Particularly for FIML, the fact that non-definition-variable dependencies remain clean is a big performance gain.

```
imxCheckMatrices imxCheckMatrices
```

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxCheckMatrices(model)

## Arguments

model model

```
    imxCheckVariables imxCheckVariables
```

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxCheckVariables(flatModel, namespace)

## Arguments

| flatModel | flatModel |
| :--- | :--- |
| namespace | namespace |

imxConDecMatrixSlots Condense/decondense slots of an MxMatrix

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxConDecMatrixSlots(object)

## Arguments

object of class MxMatrix
imxConstraintRelations
imxConstraintRelations

## Description

A string vector of valid constraint binary relations.

## Usage

imxConstraintRelations

## Format

chr [1:3] "<" "==" ">"
imxConvertIdentifier imxConvertIdentifier

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxConvertIdentifier(identifiers, modelname, namespace)

## Arguments

| identifiers | identifiers |
| :--- | :--- |
| modelname | modelname |
| namespace | namespace |

```
imxConvertLabel imxConvertLabel
```

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxConvertLabel(label, modelname, dataname, namespace)

## Arguments

label
modelname
label
dataname dataname
namespace namespace

```
    imxConvertSubstitution
```

    imxConvertSubstitution
    
## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxConvertSubstitution(substitution, modelname, namespace)

## Arguments

| substitution <br> modelname <br> namespace | substitution <br> modelname <br> namespace |
| :--- | :--- |
| imxCreateMatrix | Create a matrix |

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxCreateMatrix(.Object, labels, values, free, lbound, ubound, nrow, ncol, byrow, name, condenseSlots, persist, ...)

## Arguments

| . Object | the matrix |
| :--- | :--- |
| labels | labels |
| values | values |
| free | free |
| lbound | lbound |
| ubound | ubound |
| nrow | nrow |
| ncol | ncol |
| byrow | byrow |
| name | name |
| condenseSlots | condenseSlots |
| persist | persist |
| $\ldots$. | Not used. |

$\qquad$
imxDataTypes Valid types of data that can be contained by MxData

## Description

Valid types of data that can be contained by MxData

## Usage

imxDataTypes

## Format

```
    chr [1:5] "raw" "cov" "cor" "sscp" "acov"
```

    imxDefaultGetSlotDisplayNames
        imxDefaultGetSlotDisplayNames
    
## Description

Returns a list of display-friendly object slot names This is an internal function exported for those people who know what they are doing.

## Usage

imxDefaultGetSlotDisplayNames(x, pattern = ".*")

## Arguments

x The object from which to get slot names
pattern Initial pattern to match (default of '.*' matches any)

| imxDeparse $\quad$ Deparse for MxObjects |
| :--- | :--- |

## Description

Deparse for MxObjects

## Usage

imxDeparse(object, indent = " ")

## Arguments

> object object
indent indent
imxDependentModels Are submodels dependence?

## Description

Are submodels dependence?

## Usage

imxDependentModels(model)

## Arguments

model model
imxDetermineDefaultOptimizer imxDetermineDefaultOptimizer

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxDetermineDefaultOptimizer()

## Details

Returns a character, the default optimizer

| imxDiff $\quad$ Set difference on regular types or $S 4$ objects |
| :--- | :--- |

## Description

Set difference on regular types or S 4 objects

## Usage

imxDiff(a, b, slots = c("setequal", "intersect"))

## Arguments

a
a
b
b
slots slots

## Description

This API is visible to permit testing. Please do not use.

## Usage

imxDmvnorm(loc, mean, sigma)

## Arguments

| loc | loc |
| :--- | :--- |
| mean | mean |
| sigma | sigma |

imxEvalByName imxEvalByName

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxEvalByName(name, model, compute = FALSE, show = FALSE)

## Arguments

name name
model model
compute compute
show show

## Details

This function should not be used in MxSummary. All summary information should be extracted from runstate.

```
imxExtractMethod imxExtractMethod
```

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxExtractMethod(model, index)

## Arguments

| model | model |
| :--- | :--- |
| index | index |

```
    imxExtractNames imxExtractNames
```

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxExtractNames(lst)

## Arguments

lst
1st
imxExtractReferences imxExtractReferences

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxExtractReferences(lst)

## Arguments

lst
lst
imxExtractSlot imxExtractSlot

## Description

Checks for and extracts a slot from the object This is an internal function exported for those people who know what they are doing.

## Usage

imxExtractSlot(x, name)

## Arguments

x
name

The object
the name of the slot

```
imxFilterDefinitionVariables
```

imxFilterDefinitionVariables

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxFilterDefinitionVariables(defVars, dataName)

## Arguments

defVars defVars
dataName dataName
imxFlattenModel Remove heirarchical structure from model

## Description

Remove heirarchical structure from model

## Usage

imxFlattenModel(model, namespace)

## Arguments

| model | model |
| :--- | :--- |
| namespace | namespace |

imxFreezeModel Freeze model

## Description

Remove free parameters and fit function from model.

## Usage

imxFreezeModel(model)

## Arguments

model model

```
    imxGenerateLabels imxGenerateLabels
```

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxGenerateLabels(model)

## Arguments

model model
imxGenerateNamespace imxGenerateNamespace

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxGenerateNamespace(model)

## Arguments

model model
imxGenericModelBuilder
imxGenericModelBuilder

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxGenericModelBuilder(model, lst, name, manifestVars, latentVars, submodels, remove, independent)

## Arguments

| model | model |
| :--- | :--- |
| lst | lst |
| name | name |
| manifestVars | manifestVars |
| latentVars | latentVars |
| submodels | submodels |
| remove | remove |
| independent | independent |

```
    imxGenSwift imxGenSwift
```

## Description

This is an internal function exported for those people who know what they are doing.
Usage

\[\)|  imxGenSwift(tc, sites  |  |
| :--- | :--- |
|  Arguments  |  tc  |
|  tc  |  sites  |
|  sites  |  sfile  |

\]

imxGetSlotDisplayNames
imxGetSlotDisplayNames

## Description

Returns a list of display-friendly object slot names This is an internal function exported for those people who know what they are doing.

## Usage

imxGetSlotDisplayNames(object, pattern = ".*", slotList = slotNames(object), showDots = FALSE, showEmpty = FALSE)

## Arguments

| object | The object from which to get slot names |
| :--- | :--- |
| pattern | Initial pattern to match (default of ',.' matches any) |
| slotList | List of slots for which toget display names (default = slotNames(object), i.e., <br> all) |
| showDots | Include slots whose names start with ',' (default FALSE) |
| showEmpty | Include slots with length-zero contents (default FALSE) |

    imxHasNPSOL imxHasNPSOL
    
## Description

imxHasNPSOL

## Usage

imxHasNPSOL()

## Value

Returns TRUE if the NPSOL proprietary optimizer is compiled and linked with OpenMx. Otherwise FALSE.
imxHasOpenMP imxHasOpenMP

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxHasOpenMP()
imxIdentifier imxIdentifier

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxIdentifier (namespace, name)

## Arguments

| namespace | namespace |
| :--- | :--- |
| name | name |

imxIndependentModels Are submodels independent?

## Description

Are submodels independent?

## Usage

imxIndependentModels(model)

## Arguments

model model
imxInitModel imxInitModel

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxInitModel(model)

## Arguments

model model

```
    imxIsDefinitionVariable
```

        imxIsDefinitionVariable
    
## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxIsDefinitionVariable(name)

## Arguments

> name name

```
    imxIsPath imxIsPath
```

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxIsPath(value)

## Arguments

$$
\text { value } \quad \text { value }
$$

imxLocateFunction imxLocateFunction

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxLocateFunction(function_name)

## Arguments

function_name function_name

## imxLocateIndex imxLocateIndex

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxLocateIndex(model, name, referant)

## Arguments

| model | model |
| :--- | :--- |
| name | name |
| referant | referant |

```
imxLocateLabel imxLocateLabel
```

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxLocateLabel(label, model, parameter)

## Arguments

label label
model model
parameter parameter
imxLog Test thread-safe output code

## Description

This is the code that the backend uses to write diagnostic information to standard error. This function should not be called from R. We make it available only for testing.

## Usage

imxLog(str)

## Arguments

str the character string to output

```
    imxLookupSymbolTable imxLookupSymbolTable
```

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxLookupSymbolTable(name)

## Arguments

name name

```
imxModelBuilder imxModelBuilder
```

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxModelBuilder (model, lst, name, manifestVars, latentVars, submodels, remove, independent)

## Arguments

| model | model |
| :--- | :--- |
| lst | lst |
| name | name |
| manifestVars | manifestVars |
| latentVars | latentVars |
| submodels | submodels |
| remove | remove |
| independent | independent |

## Details

TODO: It probably makes sense to split this into separate methods. For example, modelAddVariables and modelRemoveVariables could be their own methods. This would reduce some cut\&paste duplication.
imxModelTypes imxModelTypes

## Description

A list of supported model types

## Usage

imxModelTypes

## Format

list()
$\qquad$
imxMpiWrap imxMpiWrap

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxMpiWrap(fun)

## Arguments

fun fun

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxOriginalMx(mx.filename, output.directory)

## Arguments

$m x . f i l e n a m e \quad m x . f i l e n a m e$
output.directory
output.directory

```
imxPPML imxPPML
```

## Description

Potentially enable the PPML optimization for the given model.

## Usage

imxPPML(model, flag = TRUE)

## Arguments

| model | the MxModel to evaluate |
| :--- | :--- |
| flag | whether to potentially enable PPML |

imxPPML.Test.Battery imxPPML.Test.Battery

## Description

PPML can be applied to a number of special cases. This function will test the given model for all of these special cases.

## Usage

```
imxPPML.Test.Battery(model, verbose = FALSE, testMissingness = TRUE,
        testPermutations = TRUE, testEstimates = TRUE, testFakeLatents = TRUE,
        tolerances = c(0.001, 0.001, 0.001))
```

## Arguments

model the model to test
verbose $\quad$ whether to print diagnostics
testMissingness
try with missingness
testPermutations
try with permutations
testEstimates examine estimates
testFakeLatents $\quad$ try with fake latents
tolerances $\quad$ a vector of tolerances

## Details

Requirements for model passed to this function: - Path-specified - Means vector must be present Covariance data (with data means vector) - (Recommended) All error variances should be specified on the diagonal of the S matrix, and not as a latent with a loading only on to that manifest

Function will test across all permutations of: - Covariance vs Raw data - Means vector present vs Means vector absent - Path versus Matrix specification - All orders of permutations of latents with manifests

## Description

Test that PPML solutions match non-PPML solutions.

## Usage

imxPPML.Test.Test(model, checkLL = TRUE, checkByName = FALSE, tolerance $=0.5$, testEstimates $=$ TRUE)

## Arguments

| model | the MxModel to evaluate |
| :--- | :--- |
| checkLL | whether to check log likelihood |
| checkByName | check values using their names |
| tolerance | closeness tolerance for check |
| testEstimates | whether to test for the same parameter estimates |

## Details

This is an internal function used for comparing PPML and non-PPML solutions. Generally, nondevelopers will not use this function.

```
imxPreprocessModel imxPreprocessModel
```

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxPreprocessModel(model)

## Arguments

model model

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxReplaceMethod(x, name, value)

## Arguments

| $x$ | the thing |
| :--- | :--- |
| name | name |
| value | value |

## Description

Replace parts of a model

## Usage

imxReplaceModels(model, replacements)

## Arguments

| model | model |
| :--- | :--- |
| replacements | replacements |

```
imxReplaceSlot imxReplaceSlot
```

## Description

Checks for and replaces a slot from the object This is an internal function exported for those people who know what they are doing.

## Usage

imxReplaceSlot(x, name, value, check = TRUE)

## Arguments

x
name the name of the slot
value replacement value
check $\quad$ Check replacement value for validity (default TRUE)

## Description

Vector of reserved names

## Usage

imxReservedNames

## Format

```
chr [1:6] "data" "objective" "likelihood" "fitfunction" ...
```

```
imxReverseIdentifier imxReverseIdentifier
```

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxReverseIdentifier(model, name)

## Arguments

| model | model |
| :--- | :--- |
| name | name |

    imxSameType imxSameType
    
## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxSameType(a, b)

## Arguments

| a a <br> b b <br> imxSeparatorChar imxSeparatorChar |
| :---: | :---: |

## Description

The character between the model name and the named entity inside the model.

## Usage

imxSeparatorChar

## Format

chr "."

```
    imxSfClient imxSfClient
```

## Description

As of snowfall 1.84, the snowfall supervisor process stores an internal state information in a variable named ".sfOption" that is located in the "snowfall" namespace. The snowfall client processes store internal state information in a variable named ".sfOption" that is located in the global namespace.

## Usage

```
    imxSfClient()
```

## Details

As long as the previous statement is true, then the current process is a snowfall client if-and-only-if exists(".sfOption").
imxSimpleRAMPredicate imxSimpleRAMPredicate

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxSimpleRAMPredicate(model)

## Arguments

```
    model
                        model
```

    imxSparseInvert Sparse symmetric matrix invert
    
## Description

This API is visible to permit testing. Please do not use.

## Usage

imxSparseInvert(mat)

## Arguments

mat the matrix to invert
imxSquareMatrix imxSquareMatrix

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxSquareMatrix(.Object)

## Arguments

.Object .Object
imxSymmetricMatrix imxSymmetricMatrix

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxSymmetricMatrix(.Object)

## Arguments

.Object .Object
imxTypeName imxTypeName

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxTypeName(model)

## Arguments

model model
imxUntitledName imxUntitledName

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxUntitledName()

## Details

Returns a character, the name of the next untitled entity

```
    imxUntitledNumber imxUntitledNumber
```

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxUntitledNumber()

## Details

Increments the untitled number counter and returns its value

```
imxUntitledNumberReset
```

                        imxUntitledNumberReset
    
## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxUntitledNumberReset()

## Details

Resets the imxUntitledNumber counter
imxUpdateModelValues imxUpdateModelValues

## Description

Deprecated. This function does not handle parameters with equality constraints. Do not use.

```
Usage
imxUpdateModelValues(model, flatModel, values)
```

## Arguments

| model | model |
| :--- | :--- |
| flatModel | flat model |
| values | values to update |

imxVariableTypes imxVariableTypes

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxVariableTypes

## Format

 $\operatorname{chr}(0)$
## Details

The acceptable variable types

```
imxVerifyMatrix imxVerifyMatrix
```

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxVerifyMatrix(.Object)

## Arguments

> .Object .Object

```
    imxVerifyModel imxVerifyModel
```

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxVerifyModel(model)

## Arguments

model model

```
    imxVerifyName imxVerifyName
```

## Description

This is an internal function exported for those people who know what they are doing.

## Usage

imxVerifyName(name, stackNumber)

## Arguments

| name | name |
| :--- | :--- |
| stackNumber | stackNumber |

imxVerifyReference imxVerifyReference

## Description

This is an internal function exported for those people who know what they are doing.

```
Usage
    imxVerifyReference(reference, stackNumber)
```

## Arguments

reference reference
stackNumber stackNumber
imxWlsChiSquare Calculate Chi Square for a WLS Model

## Description

This is an internal function used to calculate the Chi Square distributed fit statistic for weighted least squares models.

## Usage

imxWlsChiSquare(model, J=NA)

## Arguments

model An MxModel object with acov (WLS) data
J
Optional pre-computed Jacobian matrix

## Details

The Chi Square fit statistic for models fit with maximum likelihood depends on the difference in model fit in minus two log likelihood units between the saturated model and the more restricted model under investigation. For models fit with weighted least squares a different expression is required. If $J$ is the first derivative (Jacobian) of the mapping from the free parameters to the unique elements of the expected covariance, means, and threholds, $J_{c}$ is the orthogonal complement of $J$, $W$ is the inverse of the full weight matrix, and $e$ is the differnce between the sample-estimated and model-implied covariance, means, and thresholds, then the Chi Square fit statistic is

$$
\chi^{2}=e^{\prime} J_{c}\left(J_{c}^{\prime} W J_{c}\right)^{-} 1 J_{c}^{\prime} e
$$

with $e^{\prime}$ indicating the transpode of $e$. This Equation 2.20a from Browne (1984) where he showed that this statistic is chi-square distributed with the conventional degrees of freedom.

## Value

A named list with components
Chi numeric value of the Chi Square fit statistic.
ChiDoF degrees of freedom for the Chi Square fit statistic.

## References

```
imxWlsStandardErrors Calculate Standard Errors for a WLS Model
```

## Description

This is an internal function used to calculate standard errors for weighted least squares models.

## Usage

imxWlsStandardErrors(model)

## Arguments

model An MxModel object with acov (WLS) data

## Details

The standard errors for models fit with maximum likelihood are related to the second derivative (Hessian) of the likelihood function with respect to the free parameters. For models fit with weighted least squares a different expression is required. If $J$ is the first derivative (Jacobian) of the mapping from the free parameters to the unique elements of the expected covariance, means, and threholds, $V$ is the weight matrix used, $W$ is the inverse of the full weight matrix, and $U=$ $V J\left(J^{\prime} V J\right)^{-1}$, then the asymptotic covariance matrix of the free parameters is

$$
A \operatorname{cov}(\theta)=U^{\prime} W U
$$

with $U^{\prime}$ indicating the transpode of $U$.

## Value

A named list with components
SE The standard errors of the free parameters
Cov The full covariance matrix of the free parameters. The square root of the diagonal elements of Cov equals SE.
Jac The Jacobian computed to obtain the standard errors.

```
jointdata Joint Ordinal and continuous variables to be modeled together
```

## Description

Data set used in some of OpenMx's examples.

## Usage

data("jointdata")

## Format

A data frame with 250 observations on the following variables.
z1 Continuous variable
z2 Ordinal variable with 2 levels $(0,1)$
z3 Continuous variable
z4 Ordinal variable with 4 levels $(0,1,2,3)$
z5 Ordinal variable with 3 levels $(0,1,3)$

## Details

Data generated to test the joint ML algorithm thoroughly.

## Source

Simulated.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## Examples

```
data(jointdata)
par(mfrow=c(2, 3))
h <- lapply(jointdata, hist)
par(mfrow=c(1, 1))
plot(z2 ~ z1, jointdata)
```

```
latentMultipleRegExample1
    Example data for multiple regression among latent variables
```

## Description

Data set used in some of OpenMx's examples.

## Usage

data("latentMultipleRegExample1")

## Format

A data frame with 200 observations on the following variables.
X1 Factor 1 indicator
X2 Factor 1 indicator
X3 Factor 1 indicator
X4 Factor 1 indicator
X5 Factor 2 indicator
X6 Factor 2 indicator
X7 Factor 2 indicator
X8 Factor 2 indicator
X9 Factor 3 indicator
X10 Factor 3 indicator
X11 Factor 3 indicator
X12 Factor 3 indicator

## Details

Factor 1 strongly predicts factor 3 . Factor 2 weakly predicts factor 3 .

## Source

Simulated.

## References

#results can be replicated in OpenMx.
```

mxAlgebra Create MxAlgebra Object

## Description

This function creates a new MxAlgebra object.

## Usage

mxAlgebra(expression, name $=$ NA, dimnames $=$ NA, $\ldots$, fixed $=$ FALSE)

## Arguments

expression An R expression of OpenMx-supported matrix operators and matrix functions.
name An optional character string indicating the name of the object.
dimnames list. The dimnames attribute for the algebra: a list of length 2 giving the row and column names respectively. An empty list is treated as NULL, and a list of length one as row names. The list can be named, and the list names will be used as names for the dimensions.
... Not used. Forces argument 'fixed' to be specified by name.
fixed If TRUE, this algebra will not be recomputed automatically when things it depends on change. mxComputeOnce can be used to force it to recompute.

## Details

The mxAlgebra function is used to create algebraic expressions that operate on one or more MxMatrix objects. To evaluate an MxAlgebra object, it must be placed in an MxModel object, along with all referenced MxMatrix objects and the mxFitFunctionAlgebra function. The mxFitFunctionAlgebra function must reference by name the MxAlgebra object to be evaluated.
The following operators and functions are supported in mxAlgebra:
Operators
solve() Inversion
t() Transposition
^ Elementwise powering
\%^\% Kronecker powering

+ Addition
- Subtraction
\%*\% Matrix Multiplication
* Elementwise product
/ Elementwise division
\%x\% Kronecker product
\%\&\% Quadratic product
Functions
cov2cor Convert covariance matrix to correlation matrix
chol Cholesky Decomposition
cbind Horizontal adhesion
rbind Vertical adhesion
det Determinant
tr Trace
sum Sum
prod Product
max Maximum
min Min
abs Absolute value
sin Sine
sinh Hyperbolic sine
cos Cosine
cosh Hyperbolic cosine
tan Tangent
tanh Hyperbolic tangent
exp Exponent
log Natural Logarithm
sqrt Square root
p2z Standard-normal quantile
lgamma Log-gamma function
eigenval Eigenvalues of a square matrix. Usage: eigenval(x); eigenvec(x); ieigenval(x); ieigen$\operatorname{vec}(x)$
rvectorize Vectorize by row
cvectorize Vectorize by column
vech Half-vectorization
vechs Strict half-vectorization

```
vech2full Inverse half-vectorization
vechs2full Inverse strict half-vectorization
vec2diag Create matrix from a diagonal vector (similar to diag)
diag2vec Extract diagonal from matrix (similar to diag)
expm Matrix Exponential
logm Matrix Logarithm
omxExponential Matrix Exponential
omxMnor Multivariate Normal Integration
omxAllInt All cells Multivariate Normal Integration
omxNot Perform unary negation on a matrix
omxAnd Perform binary and on two matrices
omxOr Perform binary or on two matrices
omxGreaterThan Perform binary greater on two matrices
omxLessThan Perform binary less than on two matrices
omxApproxEquals Perform binary equals to (within a specified epsilon) on two matrices
```

## Value

Returns a new MxAlgebra object.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## Examples

```
A <- mxMatrix("Full", nrow = 3, ncol = 3, values=2, name = "A")
# Simple example: algebra B simply evaluates to the matrix A
B <- mxAlgebra(A, name = "B")
# Compute A + B
C <- mxAlgebra(A + B, name = "C")
# Compute sin(C)
D <- mxAlgebra(sin(C), name = "D")
# Make a model and evaluate the mxAlgebra object 'D'
```

```
A <- mxMatrix("Full", nrow = 3, ncol = 3, values=2, name = "A")
model <- mxModel(model="AlgebraExample", A, B, C, D )
fit <- mxRun(model)
mxEval(D, fit)
# Numbers in mxAlgebras are upgraded to 1x1 matrices
# Example of Kronecker powering (%^%) and multiplication (%*%)
A <- mxMatrix(type="Full", nrow=3, ncol=3, value=c(1:9), name="A")
m1 <- mxModel(model="kron", A, mxAlgebra(A %^% 2, name="KroneckerPower"))
mxRun(m1)$KroneckerPower
# Running kron
# mxAlgebra 'KroneckerPower'
# $formula: A %^% 2
# $result:
# [,1] [,2] [,3]
# [1,] 1
# [2,] 4 25 64
# [3,] 9
```

## Description

MxAlgebra is an S4 class. An MxAlgebra object is a named entity. New instances of this class can be created using the function mxAlgebra.

## Details

The MxAlgebra class has the following slots:

| name | $-\quad$ The name of the object |
| ---: | :--- |
| formula | $-\quad$ The $R$ expression to be evaluated |
| result | $-\quad$ a matrix with the computation result |

The 'name' slot is the name of the MxAlgebra object. Use of MxAlgebra objects in the mxConstraint function or an objective function requires reference by name.

The 'formula' slot is an expression containing the expression to be evaluated. These objects are operated on or related to one another using one or more operations detailed in the mxAlgebra help file.

The 'result' slot is used to hold the results of computing the expression in the 'formula' slot. If the containing model has not been executed, then the 'result' slot will hold a $0 \times 0$ matrix. Otherwise the slot will store the computed value of the algebra using the final estimates of the free parameters.

Slots may be referenced with the $\$$ symbol. See the documentation for Classes and the examples in the mxAlgebra document for more information.

## MxAlgebraFormula

## Description

This is an internal class for the formulas used in mxAlgebra calls.

## Description

WARNING: Objective functions have been deprecated as of OpenMx 2.0.
Please use MxFitFunctionAlgebra() instead. As a temporary workaround, MxAlgebraObjective returns a list containing a NULL MxExpectation object and an MxFitFunctionAlgebra object.
All occurrences of
$\mathrm{mxAlgebraObjective}($ algebra, numObs $=\mathrm{NA}$, numStats $=\mathrm{NA})$
Should be changed to
$m x F i t F u n c t i o n A l g e b r a($ algebra, numObs $=$ NA, numStats $=$ NA $)$

## Arguments

$$
\begin{array}{ll}
\text { algebra } & \begin{array}{l}
\text { A character string indicating the name of an MxAlgebra or MxMatrix object to } \\
\text { use for optimization. }
\end{array} \\
\text { numObs } & \text { (optional) An adjustment to the total number of observations in the model. } \\
\text { numStats } & \text { (optional) An adjustment to the total number of observed statistics in the model. }
\end{array}
$$

## Details

NOTE: THIS DESCRIPTION IS DEPRECATED. Please change to using mxFitFunctionAlgebra as shown in the example below.
Fit functions are functions for which free parameter values are chosen such that the value of the objective function is minimized. While the other fit functions in OpenMx require an expectation function for the model, the mxAlgebraObjective function uses the referenced MxAlgebra or MxMatrix object as the function to be minimized.
If a model's primary objective function is a mxAlgebraObjective objective function, then the referenced algebra in the objective function must return a $1 \times 1$ matrix (when using OpenMx's default optimizer). There is no restriction on the dimensions of an objective function that is not the primary, or 'topmost', objective function.
To evaluate an algebra objective function, place the following objects in a MxModel object: a MxAlgebraObjective, MxAlgebra and MxMatrix entities referenced by the MxAlgebraObjective, and optional MxBounds and MxConstraint entities. This model may then be evaluated using the $m x R u n$ function. The results of the optimization may be obtained using the $m x E v a l$ function on the name of the MxAlgebra, after the model has been run.

## Value

Returns a list containing a NULL MxExpectation object and an MxFitFunctionAlgebra object. MxFitFunctionAlgebra objects should be included with models with referenced MxAlgebra and MxMatrix objects.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## mxBounds Create MxBounds Object

## Description

This function creates a new MxBounds object.

## Usage

$m x$ Bounds (parameters, min $=N A, \max =N A$ )

## Arguments

parameters A character vector indicating the names of the parameters on which to apply bounds.
min A numeric value for the lower bound. NA means use default value.
$\max \quad$ A numeric value for the upper bound. NA means use default value.

## Details

Creates a set of boundaries or limits for a parameter or set of parameters. Parameters may be any free parameter or parameters from an MxMatrix object. Parameters may be referenced either by name or by referring to their position in the 'spec' matrix of an MxMatrix object.

Minima and maxima may be specified as scalar numeric values.

## Value

Returns a new MxBounds object. If used as an argument in an MxModel object, the parameters referenced in the 'parameters' argument must also be included prior to optimization.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## See Also

MxBounds for the S 4 class created by mxBounds. MxMatrix and mxMatrix for free parameter specification. More information about the OpenMx package may be found here.

## Examples

\#Create lower and upper bounds for parameters 'A' and ' B '
bounds <- mxBounds(c('A', 'B'), 3, 5)
\#Create a lower bound of zero for a set of variance parameters varianceBounds <- mxBounds(c('Var1', 'Var2', 'Var3'), 0)

```
MxBounds-class MxBounds Class
```

## Description

MxBounds is an S4 class. New instances of this class can be created using the function mxBounds.

## Details

The MxBounds class has the following slots:

$$
\begin{array}{rll}
\min & - & \text { The lower bound } \\
\max & - & \text { The upper bound } \\
\text { parameters } & - & \text { The vector of parameter names }
\end{array}
$$

The 'min' and 'max' slots hold scalar numeric values for the lower and upper bounds on the list of parameters, respectively.
Parameters may be any free parameter or parameters from an MxMatrix object. Parameters may be referenced either by name or by referring to their position in the 'spec' matrix of an MxMatrix object. To affect an estimation or optimization, an MxBounds object must be included in an MxModel object with all referenced MxAlgebra and MxMatrix objects.
Slots may be referenced with the $\$$ symbol. See the documentation for Classes and the examples in the mxBounds document for more information.

MxCharOrList-class A character, list or NULL

## Description

A character, list or NULL

MxCharOrNumber-class A character or integer

## Description

A character or integer
mxCheckIdentification Check that a model is locally identified

## Description

Use the dimension of the null space of the Jacobian to determine whether or not a model is identified local to its current parameter values. The output is a list of the the identification status, the Jacobian, and which parameters are not identified.

## Usage

mxCheckIdentification(model, details=TRUE)

## Arguments

$$
\begin{array}{ll}
\text { model } & \text { A MxModel object or list of MxModel objects. } \\
\text { details } & \text { logical. }
\end{array}
$$

## Details

The mxCheckIdentification function is used to check that a model is identified. That is, the function will tell you if the model has a unique solution in parameter space. The function is most useful when applied to either (a) a model that has been run and had some NA standard errors, or (b) a model that has not been run but has reasonable starting values. In the former situation, mxCheckIdentification is used as a diagnostic after a problem was indicated. In the latter situation, mxCheckIdentification is used as a sanity check.
The method uses the Jacobian of the model expected means and the unique elements of the expected covariance matrix with respect to the free parameters. It is the first derivative of the mapping between the free parameters and the sufficient statistics for the Normal distribution. The method
does not depend on data, but does depend on the current values of the free parameters. Thus, it only provides local identification, not global identification. Because the method does not depend on data, the model still could be empirically unidentified due to missing data.
The Jacobian is evaluated numerically and generally takes a few seconds, but much less than a minute.

The identification may not be accurate for model where definition variables are used. Currently, only the first row of the definition variable is evaluated.
When TRUE, the 'details' argument provides the names of the non-identified parameters. Otherwise, only the status and Jacobian are returned.

## Value

A named list with components
status logical. TRUE if the model is locally identified; otherwise FALSE.
jacobian matrix. The numerically evaluated Jacobian.
non_identified_parameters vector. The free parameter names that are not identified

```

```
mxCI Create mxCI Object
```

## Description

This function creates a new MxCI object, which are used to estimate likelihood-based confidence intervals.

## Usage

mxCI(reference, interval = 0.95, type=c("both", "lower", "upper"))

## Arguments

reference A character vector of free parameters, mxMatrices, mxMatrix elements and mxAlgebras on which confidence intervals are to be estimated, listed by name.
interval A scalar numeric value indicating the confidence interval to be estimated. Must be between 0 and 1. Defaults to 0.95 .
type A character string indicating whether the upper, lower or both confidence limits are returned. Defaults to "both".

## Details

The mxCI function creates MxCI objects, which can be used as arguments in MxModel objects. When models containing MxCI objects are optimized using mxRun with the 'intervals' argument set to TRUE, likelihood-based confidence intervals are returned. The likelihood-based confidence intervals calculated by MxCI objects are symmetric with respect to the change in likelihood in either direction, and are not necessarily symmetric around the parameter estimate. Estimation of confidence intervals requires both that an MxCI object be included in the model and that the 'intervals' argument of the mxRun function is set to TRUE. When estimated, confidence intervals can be accessed in the model output at \$output\$confidenceIntervals or by using summary on a fitted MxModel object.

A typical use case is when a parameter estimate is obtained that is at or near a lower bound. In this case, there is no point in computing the lower part of the CI. Only the upper bound is needed. In all
cases, a two-sided hypothesis test is assumed. Therefore, the upper bound will exclude $2.5 \%$ (for interval $=0.95$ ) even though only one bound is requested. To obtain a one-sided CI for a one-sided hypothesis test, interval= 0.90 will obtain a $95 \%$ confidence interval.

The likelihood-based confidence intervals returned using MxCI are obtained by increasing or decreasing the value of each parameter until the -2 log likelihood of the model increases by an amount corresponding to the requested interval. The confidence limit specified by the 'interval' argument is transformed into a corresponding difference in the model -2 log likelihood based on the likelihood ratio test. Thus, a requested confidence interval for a parameter will first determine the corresponding quantile from the chi-squared distribution with one degree of freedom (a value of 3.841459 when a 95 percent confidence interval is requested). That quantile will be populated into either the 'lowerdelta' slot, the 'upperdelta' slot, or both in the output MxCI object.

Estimation of likelihood-based confidence intervals begins after optimization has been completed, with each parameter moved in the direction(s) specified in the 'type' argument until the specified increase in $-2 \log$ likelihood is reached. All other free parameters are left free for this stage of optimization. This process repeats until all confidence intervals have been calculated. The calculation of likelihood-based confidence intervals can be computationally intensive, and may add a significant amount of time to model estimation when many confidence intervals are requested.

Multiple parameters, MxMatrices and MxAlgebras may be listed in the 'reference' argument. Individual elements of MxMatrices and MxAlgebras may be listed as well, using the syntax "matrix[row,col]" (see Extract for more information). Only scalar numeric values for the 'interval' argument are supported. Users requesting different confidence ranges for different parameters must use separate mxCI statements. MxModel objects can hold multiple MxCI objects, but only one confidence interval may be requested per named-entity.

Confidence interval estimation may result in model non-convergence at the confidence limit. Separate optimizer messages may be passed for each confidence limit. This has no impact on the parameter estimates themselves, but may indicate a problem with the referenced confidence limit. Model non-convergence for a particular confidence limit may indicate parameter interdependence or the influence of a parameter boundary.

These error messages and their meanings are listed in the help for mxSummary
The validity of a confidence limit can be checked by running a model with the appropriate parameter fixed at the confidence limit in question. If the confidence limit is valid, the $-2 \log$ likelihoods of these two models should differ by the specified chi-squared criterion (as set using the 'lowerdelta' or 'upperdelta' slots in the MxCI object (you can choose which of these to set via the type parameter of mxCI ).

## Value

Returns a new MxCI object. If used as an argument in an MxModel object, the parameters, MxMatrices and MxAlgebras listed in the 'reference' argument must also be included prior to optimization.

## References

# run the model
results <- mxRun(model, intervals=TRUE)
# view confidence intervals
print(summary(results)$CI)
# view all results
summary(results)
```

MxCI-class MxCI Class

## Description

MxCI is an S4 class. An MxCI object is a named entity. New instances of this class can be created using the function mxCI. MxCI objects may be used as arguments in the mxModel function.

## Details

The MxCI class has the following slots:

> reference - The name of the object
> lowerdelta - Either a matrix or a data frame
> upperdelta - A vector for means, or NA if missing

The reference slot contains a character vector of named free parameters, MxMatrices and MxAlgebras on which confidence intervals are desired. Individual elements of MxMatrices and MxAlgebras may be listed as well, using the syntax "matrix[row,col]" (see Extract for more information).

The lowerdelta and upperdelta slots give the changes in likelihoods used to define the confidence interval. The upper bound of the likelihood-based confidence interval is estimated by increasing the parameter estimate, leaving all other parameters free, until the model $-2 \log$ likelihood increased by 'upperdelta'. The lower bound of the confidence interval is estimated by decreasing the parameter estimate, leaving all other parameters free, until the model $-2 \log$ likelihood increased by 'lowerdata'.
Likelihood-based confidence intervals may be specified by including one or more MxCI objects in an MxModel object. Estimation of confidence intervals requires model optimization using the mxRun function with the 'intervals' argument set to TRUE. The calculation of likelihood-based confidence intervals can be computationally intensive, and may add a significant amount of time to model estimation when many confidence intervals are requested.

## mxCompare Assign Model Parameters

## Description

Compare the fit of a model or set of models to a reference model or set of reference models. The output is a table with one row per model comparison.

```
Usage
    mxCompare(base, comparison, ...., all = FALSE)
```

mxCompare

## Arguments

base A MxModel object or list of MxModel objects.
comparison
...
all A boolean value on whether to compare all bases with all comparisons. Defaults to FALSE.

## Details

The mxCompare function is used to compare the fit of one or more MxMatrix objects with output to one or more comparison models. Fit statistics for the comparison model or models are subtracted from the fit statistics for the base model or models. All models included in the 'base' argument are also listed without comparison (compared to a $<\mathrm{NA}>$ model) to present their raw fit statistics.
Model comparisons are made by subtracting the fit of the comparison model from the fit of a base model. To make sure that the differences between models are positive and yield p-values for likelihood ratio tests, the model or models listed in the 'base' argument should be more saturated (i.e., more estimated parameters and fewer degrees of freedom) than models listed in the 'comparison' argument. If a comparison is made where the comparison model has a higher minus 2 log likelihood $(-2 L L)$ than the base model, then the difference in their -2LLs will be negative. P-values for likelihood ratio tests will not be reported when either the - 2 LL or degrees of freedom for the comparison are negative.
When multiple models are included in both the 'base' and 'comparison' arguments, then comparisons are made between the two lists of models based on the value of the 'all' argument. If 'all' is set to FALSE (default), then the first model in the 'base' list is compared to the first model in the 'comparison' list, second with second, and so on. If there are an unequal number of 'base' and 'comparison' models, then the shorter list of models is repeated to match the length of the longer list. For example, comparing base models 'B1' and 'B2' with comparison models 'C1', 'C2' and 'C3' will yield three comparisons: 'B1' with 'C1', 'B2' with 'C2', and 'B1' with 'C3'. Each of those comparisons are prefaced by a comparison between the base model and a missing comparison model to present the fit of the base model.
If 'all' is set to TRUE, all possible comparisons between base and comparison models are made, and one entry is made for each base model. All comparisons involving the first model in 'base' are made first, followed by all comparisons with the second 'base' model, and so on. When there are multiple models in either the 'base' or 'comparison' arguments but not both, then the 'all' argument does not affect the set of comparisons made.
The following columns appear in the output:
base Name of the base model.
comparison Name of the comparison model. Is $<$ NA $>$ for the first
ep Estimated parameters of the comparison model.
minus2LL Minus $2 * \log$-likelihood of the comparison model. If the comparison model is $\langle\mathrm{NA}\rangle$, then the minus $2 * \log$-likelihood of the base model is given.
df Degrees in freedom of the comparison model. If the comparison model is $<\mathrm{NA}\rangle$, then the degrees of freedom of the base model is given.

AIC Akaike's Information Criterion for the comparison model. If the comparison model is <NA>, then the AIC of the base model is given.
diffLL Difference in minus $2 * \log$-likelihoods of the base and comparison models. Will be positive when base model -2LL is higher than comparison model -2LL.
diffdf Difference in degrees of freedoms of the base and comparison models. Will be positive when base model DF is lower than comparison model DF (base model estimated parameters is higher than comparison model estimated parameters)
p P-value for likelihood ratio test based on diffLL and diffdf values.
The mxCompare function will give a p-value for any comparison in which both 'diffLL' and 'diffdf' are non-negative. However, this p-value is based on the assumptions of the likelihood ratio test, specifically that the two models being compared are nested. The likelihood ratio test and associated p-values are not valid when the comparison model is not nested in the referenced base model.
Use options('digits' $=\mathrm{N}$ ) to set the minimum number of significant digits to be printed in values. The mxCompare function does not directly accept a digits argument, and depends on the value of the 'digits' option.

## Examples

```
data(demoOneFactor)
manifests <- names(demoOneFactor)
latents <- c("G1")
model1 <- mxModel(model="One Factor", type="RAM",
    manifestVars = manifests,
    latentVars = latents,
    mxPath(from = latents, to=manifests),
    mxPath(from = manifests, arrows = 2),
    mxPath(from = latents, arrows = 2, free = FALSE, values = 1.0),
    mxData(cov(demoOneFactor), type = "cov", numObs = 500)
)
fit1 <- mxRun(model1)
latents <- c("G1", "G2")
model2 <- mxModel(model="Two Factor", type="RAM",
    manifestVars = manifests,
    latentVars = latents,
    mxPath(from = latents[1], to=manifests[1:3]),
    mxPath(from = latents[2], to=manifests[4:5]),
    mxPath(from = manifests, arrows = 2),
    mxPath(from = latents, arrows = 2, free = FALSE, values = 1.0),
    mxData(cov(demoOneFactor), type = "cov", numObs=500)
)
fit2 <- mxRun(model2)
```

mxCompare(fit1, fit2)
\# vary precision of the output
oldPrecision = as.numeric(options('digits'))
options('digits' = 1)
mxCompare(fit1, fit2)
options('digits' = oldPrecision)
MxCompute-class MxCompute

## Description

This is an internal class and should not be used directly.

```
mxComputeConfidenceInterval
```

Find likelihood-based confidence intervals

## Description

There are various ways to pose an equivalent profile likelihood problem. For good performance, it is essential to tailor the problem to the abilities of the optimizer. The problem can be posed without the use of constraints. This is how the code worked in version 2.1 and prior. Although this way of posing the problem creates an ill-conditioned Hessian, NPSOL is somehow able to isolate the poor conditioning from the rest of the problem and optimize it quickly. However, SLSQP is not so clever and exhibits very poor performance. For SLSQP, good performance is contingent on posing the problem using an inequality constraint on the fit.

## Usage

mxComputeConfidenceInterval(plan, ..., freeSet = NA_character_, verbose $=0 \mathrm{~L}$, engine $=$ NULL, fitfunction = "fitfunction", tolerance $=$ NA_real_, constraintType = "ineq")

## Arguments

| plan | compute plan to optimize the model |
| :--- | :--- |
| $\ldots$ | Not used. Forces remaining arguments to be specified by name. |
| freeSet | names of matrices containing free variables |
| verbose | level of debugging output |
| engine | deprecated |
| fitfunction | The deviance function to constrain with an inequality constraint. |
| tolerance | deprecated |
| constraintType | one of c('ineq', 'eq', 'both', 'none') |

## Details

Geometrically, SLSQP performs best on smooth likelihood surfaces with smooth derivatives. In the profile CI problem, the distance limit on the deviance is like a wall. Walls do not have smooth
 problem that are geometrically non-smooth. Constraints are dealt with specially in SLSQP to best accommodate their sharp geometry.
For the default compute plan, the choice of constraintType is determined by which optimizer is selected.

## References

Pek, J. \& Wu, H. (in press). Profile likelihood-based confidence intervals and regions for structural equation models. Psychometrica.

```
mxComputeDefault Default compute plan
```

## Description

The default compute plan is approximately as follows: mxComputeSequence(list(mxComputeGradientDescent(),mxComp

## Usage

mxComputeDefault(freeSet = NA_character_)

## Arguments

freeSet names of matrices containing free variables

| mxComputeEM | Fit a model using DLR's (1977) Expectation-Maximization (EM) al- <br> gorithm |
| :--- | :--- |

## Description

The EM algorithm constitutes the following steps: Start with an initial parameter vector. Predict the missing data to form a completed data model. Optimize the completed data model to obtain a new parameter vector. Repeat these steps until convergence criteria are met.

## Usage

mxComputeEM(expectation, predict, mstep, observedFit = "fitfunction", ..., maxIter $=500 \mathrm{~L}$, tolerance $=1 \mathrm{e}-09$, verbose $=0 \mathrm{~L}$, freeSet = NA_character_, accel = "varadhan2008", information = NA_character_, infoArgs = list())

## Arguments

expectation a vector of expectation names
predict what to predict from the observed data (available options depend on the expectation)
mstep a compute plan to optimize the completed data model
observedFit the name of the observed data fit function (defaults to "fitfunction")
... Not used. Forces remaining arguments to be specified by name.
maxIter maximum number of iterations
tolerance optimization is considered converged when the maximum relative change in fit is less than tolerance
verbose level of diagnostic output
freeSet names of matrices containing free variables
accel name of acceleration method ("varadhan2008" or "ramsay1975")
information name of information matrix approximation method
infoArgs arguments to control the information matrix method

## Details

This compute plan does not work with any and all expectations. It requires a special kind of expectation that can predict its missing data to create a completed data model.

The EM algorithm does not produce a parameter covariance matrixn for standard errors. S-EM, an implementation of Meng \& Rubin (1991), is included.

```
mxComputeGradientDescent
```

Optimize parameters using a gradient descent optimizer

## Description

This optimizer does not require analytic derivatives of the fit function. The open-source version of OpenMx only offers 1 choice, SLSQP (from the NLOPT collection). The proprietary version of OpenMx offers the choice of two optimizers, SLSQP and NPSOL.

## Usage

mxComputeGradientDescent(freeSet = NA_character_, ..., engine = NULL, fitfunction = "fitfunction", verbose = 0L, tolerance = NA_real_, useGradient = NULL, warmStart = NULL, nudgeZeroStarts = TRUE, maxMajorIter = NULL, gradientAlgo = mxOption(NULL, "Gradient algorithm"), gradientIterations $=2$, gradientStepSize = 1e-05)

## Arguments

freeSet names of matrices containing free variables
... Not used. Forces remaining arguments to be specified by name.
engine specific NPSOL or SLSQP
fitfunction name of the fitfunction (defaults to 'fitfunction')
verbose level of debugging output
tolerance how close to the optimum is close enough (also known as the optimality tolerance)
useGradient whether to use the analytic gradient (if available)
warmStart a Cholesky factored Hessian to use as the NPSOL Hessian starting value (preconditioner)
nudgeZeroStarts
whether to nudge any zero starting values prior to optimization (default TRUE)
maxMajorIter maximum number of major iterations
gradientAlgo one of c('forward','central')
gradientIterations
number of Richardson iterations to use for the gradient (default 2)
gradientStepSize
the step size for the gradient (default 1e-5)

## Details

One of the most important options for SLSQP is gradientAlgo. By default, the forward method is used. This method requires gradientIterations function evaluations per parameter per gradient. This method often works well enough but can result in imprecise gradient estimations that may not allow SLSQP to fully optimize a given model. If code red is reported then you are encouraged to try the central method. The central method requires 2 times gradientIterations function evaluations per parameter per gradient, but it can be much more accurate.

## Examples

```
data(demoOneFactor)
factorModel <- mxModel(name ="One Factor",
    mxMatrix(type="Full", nrow=5, ncol=1, free=FALSE, values=0.2, name="A"),
        mxMatrix(type="Symm", nrow=1, ncol=1, free=FALSE, values=1, name="L"),
        mxMatrix(type="Diag", nrow=5, ncol=5, free=TRUE, values=1, name="U"),
        mxAlgebra(expression=A %*% L %*% t(A) + U, name="R"),
    mxExpectationNormal(covariance="R", dimnames=names(demoOneFactor)),
    mxFitFunctionML(),
        mxData(observed=cov(demoOneFactor), type="cov", numObs=500),
            mxComputeSequence(steps=list(
            mxComputeGradientDescent(),
            mxComputeNumericDeriv(),
            mxComputeStandardError(),
            mxComputeHessianQuality()
        )))
factorModelFit <- mxRun(factorModel)
factorModelFit$output$conditionNumber # 29.5
```

```
mxComputeHessianQuality
```

    Compute the quality of the Hessian
    
## Description

Tests whether the Hessian is positive definite (model\$output\$infoDefinite) and, if so, computes the condition number (model\$output\$conditionNumber). See Luenberger \& Ye (2008) Second Order Test (p. 190) and Condition Number (p. 239).

## Usage

mxComputeHessianQuality(freeSet = NA_character_)

## Arguments

freeSet names of matrices containing free variables

## References

Luenberger, D. G. \& Ye, Y. (2008). Linear and nonlinear programming. Springer.
mxComputeIterate Repeatedly invoke a series of compute objects until change is less than tolerance

## Description

One step (typically the last) must compute the fit or maxAbsChange.

```
Usage
    mxComputeIterate(steps, ..., maxIter = 500L, tolerance = 1e-09,
        verbose = 0L, freeSet = NA_character_)
```

## Arguments

steps a list of compute objects
... Not used. Forces remaining arguments to be specified by name.
maxiter the maximum number of iterations
tolerance iterates until maximum relative change is less than tolerance
verbose level of debugging output
freeSet Names of matrices containing free variables.
mxComputeNewtonRaphson
Optimize parameters using the Newton-Raphson algorithm

## Description

This optimizer requires analytic 1 st and 2 nd derivatives of the fit function. Comprehensive diagnostics are available by increasing the verbose level.

## Usage

mxComputeNewtonRaphson(freeSet = NA_character_, ..., fitfunction = "fitfunction", maxIter $=100 \mathrm{~L}$, tolerance $=1 \mathrm{e}-12$, verbose = 0L)

## Arguments

freeSet names of matrices containing free variables
... Not used. Forces remaining arguments to be specified by name.
fitfunction name of the fitfunction (defaults to 'fitfunction')
maxIter maximum number of iterations
tolerance optimization is considered converged when the maximum relative change in fit is less than tolerance
verbose level of debugging output

## References

Luenberger, D. G. \& Ye, Y. (2008). Linear and nonlinear programming. Springer.

```
mxComputeNothing Compute nothing
```

## Description

Note that this compute plan actually does nothing whereas mxComputeOnce("expectation", "nothing") may remove the prediction of an expectation.

## Usage

mxComputeNothing()
mxComputeNumericDeriv Numerically estimate Hessian using Richardson extrapolation

## Description

For N free parameters, Richardson extrapolation requires (iterations * $\left(\mathrm{N}^{\wedge} 2+\mathrm{N}\right)$ ) function evaluations.

## Usage

$m x$ ComputeNumericDeriv(freeSet $=$ NA_character_,.. , fitfunction = "fitfunction", parallel = TRUE, stepSize $=1 \mathrm{e}-04$, iterations $=4 \mathrm{~L}$, verbose $=0 \mathrm{~L}$, knownHessian $=$ NULL)

## Arguments

| freeSet | names of matrices containing free variables |
| :--- | :--- |
| $\ldots$ | Not used. Forces remaining arguments to be specified by name. |
| fitfunction | name of the fitfunction (defaults to 'fitfunction') |
| parallel | whether to evaluate the fitfunction in parallel (defaults to TRUE) |
| stepSize | starting set size (defaults to 0.0001) |
| iterations | number of Richardson extrapolation iterations (defaults to 4L) |
| verbose | Level of debugging output. |
| knownHessian | an optional matrix of known Hessian entries |

## Details

The implementation is closely based on the numDeriv R package.

## Examples

```
library(OpenMx)
data(demoOneFactor)
factorModel <- mxModel(name ="One Factor",
mxMatrix(type = "Full", nrow = 5, ncol = 1, free = FALSE, values = . 2, name = "A"),
mxMatrix(type = "Symm", nrow = 1, ncol = 1, free = FALSE, values = 1 , name = "L"),
mxMatrix(type = "Diag", nrow = 5, ncol = 5, free = TRUE , values = 1 , name = "U"),
mxAlgebra(A %*% L %*% t(A) + U, name = "R"),
mxExpectationNormal(covariance = "R", dimnames = names(demoOneFactor)),
mxFitFunctionML(),
mxData(cov(demoOneFactor), type = "cov", numObs = 500),
mxComputeSequence(
list(mxComputeNumericDeriv(), mxComputeReportDeriv())
)
)
factorModelFit <- mxRun(factorModel)
factorModelFit$output$hessian
```

```
mxComputeOnce
```

## Description

Some models are optimized for a sparse Hessian. Therefore, it can be much more efficient to compute the inverse Hessian in comparison to computing the Hessian and then inverting it.

## Usage

mxComputeOnce(from, what = "nothing", how = NULL, ..., freeSet $=$ NA_character_, verbose $=0 L$, .is.bestfit $=$ FALSE)

## Arguments

| from | the object to perform the computation (a vector of expectation or fit function <br> names) |
| :--- | :--- |
| what | what to compute (default is "nothing") |
| how | to compute it (optional) |
| $\ldots$ | Not used. Forces remaining arguments to be specified by name. |
| freeSet | names of matrices containing free variables |
| verbose | the level of debugging output |
| .is.bestfit | do not use; for backward compatibility |

## Details

The information matrix is only valid when parameters are at the maximum likelihood estimate. The information matrix is returned in model\$output\$hessian. You cannot request both the information matrix and the Hessian. The information matrix is invarient to the sign of the log likelihood scale whereas the Hessian is not. Use the how parameter to specify which approximation to use (one of "default", "hessian", "sandwich", "bread", and "meat").

## Examples

```
data(demoOneFactor)
factorModel <- mxModel(name ="One Factor",
    mxMatrix(type="Full", nrow=5, ncol=1, free=TRUE, values=0.2, name="A"),
        mxMatrix(type="Symm", nrow=1, ncol=1, free=FALSE, values=1, name="L"),
        mxMatrix(type="Diag", nrow=5, ncol=5, free=TRUE, values=1, name="U"),
        mxAlgebra(expression=A %*% L %*% t(A) + U, name="R"),
        mxFitFunctionML(),mxExpectationNormal(covariance="R", dimnames=names(demoOneFactor)),
            mxData(observed=cov(demoOneFactor), type="cov", numObs=500),
        mxComputeOnce('fitfunction', 'fit'))
factorModelFit <- mxRun(factorModel)
factorModelFit$output$fit # 972.15
```

mxComputeReportDeriv Report derivatives

## Description

Copy the internal gradient and Hessian back to R.

## Usage

mxComputeReportDeriv(freeSet = NA_character_)

## Arguments

freeSet names of matrices containing free variables

## Description

Invoke a series of compute objects in sequence

## Usage

mxComputeSequence(steps = list(), ..., freeSet = NA_character_, independent = FALSE)

## Arguments

| steps | a list of compute objects |
| :--- | :--- |
| $\ldots$ | Not used; forces argument 'freeSet' to be specified by name. |
| freeSet | Names of matrices containing free parameters. |
| independent | Whether the steps could be executed out-of-order. |

mxComputeStandardError
Compute standard errors given the Hessian or inverse Hessian

## Description

Compute standard errors given the Hessian or inverse Hessian

## Usage

mxComputeStandardError(freeSet = NA_character_)

## Arguments

freeSet names of matrices containing free variables

## Description

This function creates a new MxConstraint object.

## Usage

mxConstraint(expression, name = NA, ...)

## Arguments

expression An $R$ expression of matrix operators and matrix functions.
name
An optional character string indicating the name of the object.
Not used. Helps OpenMx catch bad input to argument 'expression'.

## Details

The mxConstraint function defines relationships between two MxAlgebra or MxMatrix objects. They are used to affect the estimation of free parameters in the referenced objects. The constraint relation is written identically to how a MxAlgebra expression would be written. The outermost operator in this relation must be either ' $<$ ', ' $==$ ' or ' $>$ '. To affect an estimation or optimization, an MxConstraint object must be included in an MxModel object with all referenced MxAlgebra and MxMatrix objects.
Usage Note: Use of mxConstraint should be avoided where it is possible to achieve the constraint by equating free parameters by label or position in an MxMatrix or MxAlgebra object. Including $m x$ Constraints in an mxModel will disable standard errors and the calculation of the final Hessian, and thus should be avoided when standard errors are of importance. Constraints also add computational overhead. If one labels two parameters the same, the optimizer has one fewer parameter to optimize. However, if one uses mxConstraint to do the same thing, both parameters remain estimated and a Lagrangian multiplier is added to maintain the constraint. This constraint also has to have its gradients computed and the order of the Hessian grows as well. So while both approaches should work, the $m x C o n s t r a i n t()$ will take longer to do so.
Alernatives to mxConstraints include using labels, lbound or ubound arguments or algebras. Free parameters in the same MxModel may be constrained to equality by giving them the same name in their respective 'labels' matrices. Similarly, parameters may be fixed to an individual element in a MxModel object or the result of an MxAlgebra object through labeling. For example, assigning a label of "name[1,1]" fixes the value of a parameter at the value in first row and first column of the matrix or algebra "name". The mxConstraint function should be used to enforce inequalities that cannot be conveyed using other methods.

## Value

Returns an MxConstraint object.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## Examples

```
library(OpenMx)
#Create a constraint between MxMatrices 'A' and 'B'
constraint <- mxConstraint(A > B, name = 'AdominatesB')
# Constrain matrix 'K' to be equal to matrix 'limit'
model <- mxModel(model="con_test",
    mxMatrix(type="Full", nrow=2, ncol=2, free=TRUE, name="K"),
    mxMatrix(type="Full", nrow=2, ncol=2, free=FALSE, name="limit", values=1:4),
    mxConstraint(K == limit, name = "Klimit_equality"),
    mxAlgebra(min(K), name="minK"),
    mxFitFunctionAlgebra("minK")
)
fit <- mxRun(model)
fit$matrices$K$values
# [,1] [,2]
# [1,] 1 3
# [2,] 2 4
# Constrain both free parameters of a matrix to equality using labels (both are set to "eq")
equal <- mxMatrix("Full", 2, 1, free=TRUE, values=1, labels="eq", name="D")
# Constrain a matrix element in to be equal to the result of an algebra
start <- mxMatrix("Full", 1, 1, free=TRUE, values=1, labels="param", name="F")
alg <- mxAlgebra(log(start), name="logP")
# Force the fixed parameter in matrix G to be the result of the algebra
end <- mxMatrix("Full", 1, 1, free=FALSE, values=1, labels="logP[1,1]", name="G")
```

## Description

MxConstraint is an S4 class. An MxConstraint object is a named entity. New instances of this class can be created using the function $m x$ Constraint.

## Details

The MxConstraint class has the following slots:

$$
\begin{aligned}
\text { name } & - \text { The name of the object } \\
\text { formula } & -\quad \text { The } \mathrm{R} \text { expression to be evaluated }
\end{aligned}
$$

The 'name' slot is the name of the MxConstraint object. Use of MxConstraint objects in other functions in the OpenMx library may require reference by name.
The 'formula' slot is an expression containing the expression to be evaluated. These objects are operated on or related to one another using one or more operations detailed in the mxConstraint help file.

Slots may be referenced with the $\$$ symbol. See the documentation for Classes and the examples in the mxConstraint document for more information.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## See Also

$m x$ Constraint for the function that creates MxConstraint objects.

```
mxData Create MxData Object
```

## Description

This function creates a new MxData object.

## Usage

$m x D a t a(o b s e r v e d$, type, means $=N A$, numObs $=N A$, acov=NA, fullWeight=NA, thresholds=NA, ..., sort=TRUE)

## Arguments

observed A matrix or data.frame which provides data to the MxData object.
type A character string defining the type of data in the 'observed' argument. Must be one of "raw", "cov", or "cor".
means An optional vector of means for use when 'type' is "cov", or "cor".
numObs The number of observations in the data supplied in the 'observed' argument. Required unless 'type' equals "raw".
acov Asymptotic covariance matrix of observed, means, and thresholds. Used for weighted least squares at weight matrix.

| fullWeight | Full asymptotic covariance matrix of observed, means, and thresholds. Used for <br> weighted least squares in standard error and quasi-chi-squared calculation. |
| :--- | :--- |
| thresholds | Observed thresholds. Used for weighted least squares with ordinal data. |
| $\ldots$ | Not used. Forces remaining arguments to be specified by name. |
| sort | Whether to sort raw data prior to use (default TRUE) |

## Details

The mxData function creates MxData objects, which can be used as arguments in MxModel objects. The 'observed' argument may take either a data frame or a matrix, which is then described with the 'type' argument. Data types describe compatibility and usage with expectation functions in MxModel objects. Four different data types are supported (a fifth, sscp, is not yet implemented):
raw The contents of the 'observed' argument are treated as raw data. Missing values are permitted and must be designated as the system missing value. The 'means' and 'numObs' arguments cannot be specified, as the 'means' argument is not relevant and the 'numObs' argument is automatically populated with the number of rows in the data. Data of this type may use fit functions such as mxFitFunctionML function in MxModel objects, which will automatically use covariance estimation under full-information maximum likelihood for this data type.
cov The contents of the 'observed' argument are treated as a covariance matrix. The 'means' argument is not required, but may be included for estimations involving means. The 'numObs' argument is required, which should reflect the number of observations or rows in the data described by the covariance matrix. Data of this type may use the fit functions such as mxFitFunctionML, depending on the specified model.
cor The contents of the 'observed' argument are treated as a correlation matrix. The 'means' argument is not required, but may be included for estimations involving means. The 'numObs' argument is required, which should reflect the number of observations or rows in the data described by the covariance matrix. Data of this type may use the fit functions such as mxFitFunctionML functions, depending on the specified model.
acov The contents of the 'observed' argument are treated as the polychoric correlation matrix of the ordinal variables. The 'means' argument is not required, but may be included for estimations involving means. The 'thresholds' argument is not required, but may be included for estimations involving thresholds and ordinal variables. The 'numObs' argument is required, which should reflect the number of observations or rows in the data described by the polychoric correlation matrix. Data of this type may use the fit functions such as mxFitFunctionWLS functions, depending on the specified model.

MxData objects may not be included in MxAlgebra objects or use the mxFitFunctionAlgebra function. If these capabilities are desired, data should be appropriately input or transformed using the $m x M a t r i x ~ a n d ~ m x A l g e b r a ~ f u n c t i o n s . ~$
While column names are stored in the 'observed' slot of MxData objects, these names are not recognized as variable names in MxPath objects. Variable names must be specified using the 'manifestVars' argument of the mxModel function prior to use in MxPath objects.

The mxData function does not currently place restrictions on the size, shape, or symmetry of matrices input into the 'observed' argument. While it is possible to specify MxData objects as covariance or correlation matrices that do not have the properties commonly associated with these matrices, failure to correctly specify these matrices will likely lead to problems in model estimation.

OpenMx uses the names of variables to map them onto the expectation functions and other elements associated with your model. For data.frames, ensure you have set the names(). For matrices set names using, for instance, row.names=c("your", "columns"). Covariance and correlation matrices need to have both the row and column names set and these must be identical, for instance by using dimnames=list(varNames, varNames).

## Value

Returns a new MxData object.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## See Also

MxData for the S 4 class created by mxData. matrix and data.frame for objects which may be entered as arguments in the 'observed' slot. More information about the OpenMx package may be found here.

## Examples

```
library(OpenMx)
#Create a covariance matrix
covMatrix <- matrix( c(0.77642931, 0.39590663,
    0.39590663, 0.49115615),
    nrow = 2, ncol = 2, byrow = TRUE)
covNames <- c("x", "y")
dimList <- list(covNames, covNames)
dimnames(covMatrix) <- dimList
#Create an MxData object including that covariance matrix

```
MxData-class MxData Class
```

## Description

MxData is an S4 class. An MxData object is a named entity. New instances of this class can be created using the function mxData. MxData is an S4 class union. An MxData object is either NULL or a MxNonNullData object.

## Details

The MxNonNullData class has the following slots:

| name | $-\quad$ The name of the object |
| ---: | :--- |
| observed | - Either a matrix or a data frame |
| vector | - A vector for means, or NA if missing |
| type | $-\quad$ Either 'raw', 'cov', or 'cor' |
| numObs | $-\quad$ The number of oberservations |

The 'name' slot is the name of the MxData object.
The 'observed' slot is used to contain data, either as a matrix or as a data frame. Use of the data in this slot by other functions depends on the value of the 'type' slot. When 'type' is equal to 'cov' or 'cor', the data input into the 'matrix' slot should be a symmetric matrix or data frame.
The 'vector' slot is used to contain a vector of numeric values, which is used as a vector of means for MxData objects with 'type' equal to 'cov' or 'cor'. This slot may be used in estimation using the $m x F i t F u n c t i o n M L$ function.

The 'type' slot may take one of four supported values:
raw The contents of the 'observed' slot are treated as raw data. Missing values are permitted and must be designated as the system missing value. The 'vector' and 'numObs' slots cannot be specified, as the 'vector' argument is not relevant and the 'numObs' argument is automatically populated with the number of rows in the data. Data of this type may use the mxFitFunctionML function as its fit function in MxModel objects, which can deal with covariance estimation under full-information maximum likelihood.
cov The contents of the 'observed' slot are treated as a covariance matrix. The 'vector' argument is not required, but may be included for estimations involving means. The 'numObs' slot is required. Data of this type may use fit functions such as the mxFitFunctionML, depending on the specified model.
cor The contents of the 'observed' slot are treated as a correlation matrix. The 'vector' argument is not required, but may be included for estimations involving means. The 'numObs' slot is required. Data of this type may use fit functions such as the mxFitFunctionML, depending on the specified model.

The 'numObs' slot describes the number of observations in the data. If 'type' equals 'raw', then 'numObs' is automatically populated as the number of rows in the matrix or data frame in the 'observed' slot. If 'type' equals 'cov' or 'cor', then this slot must be input using the 'numObs' argument in the mxData function when the MxData argument is created.
MxData objects may not be included in MxAlgebra objects or use the mxFitFunctionAlgebra function. If these capabilities are desired, data should be appropriately input or transformed using the $m x$ Matrix and mxAlgebra functions.

While column names are stored in the 'observed' slot of MxData objects, these names are not recognized as variable names in MxPath objects. Variable names must be specified using the 'manifestVars' argument of the mxModel function prior to use in MxPath objects.
The mxData function does not currently place restrictions on the size, shape, or symmetry of matrices input into the 'observed' argument. While it is possible to specify MxData objects as covariance or correlation matrices that do not have the properties commonly associated with these matrices, failure to correctly specify these matrices will likely lead to problems in model estimation.

## MxDataStatic-class Create static data

## Description

Internal static data class.

## Details

Not to be used.

```
mxDataWLS
```

Create MxData Object for Least Squares (WLS, DLS, ULS) Analyses

## Description

This function creates a new MxData object of type "ULS" (unweighted least squares), "WLS" (weighted least squares) or "DLS" (diagonally-weighted least squares). The appropriate fit function to include with these models is mxFitFunctionWLS

## Usage

```
mxDataWLS(data, type = "WLS", useMinusTwo = TRUE, returnInverted = TRUE,
    debug = FALSE, fullWeight = TRUE)
```

## Arguments

data A matrix or data.frame which provides raw data to be used for WLS.
type A character string 'WLS' (default), 'DLS', or 'ULS' for weighted, diagonal, or unweighted least squares
useMinusTwo Logical indicating whether to use -2LL (default) or -LL.
returnInverted Logical indicating whether to return the information matrix (default) or the covariance matrix.
debug Logical to set debugging on or off (default)
fullWeight Logical determining if the full weight matrix is returned (default). Needed for standard error and quasi-chi-squared calculation.

## Details

The mxDataWLS function creates an MxData object, which can be used in MxModel objects. This function takes raw data and returns an MxData object to be used in a model to fit with weighted least squares.
Both Ordinal and continuous data are supported. A combination of these data types succeeds without error, but when using 'WLS' or 'DLS' the answers appear incorrect. The 'ULS' estimates for joint ordinal and continuous data appear accurate. Consequently, do not use this function for joint problems unless type='ULS'.

## Value

Returns a new MxData object.

```

MxDirectedGraph-class MxDirectedGraph

## Description

This is an internal class and should not be used directly. It is a class for directed graphs.
mxEval Evaluate Values in MxModel

## Description

This function can be used to evaluate an arbitrary R expression that includes named entities from a MxModel object, or labels from a MxMatrix object.

## Usage

```
mxEval(expression, model, compute = FALSE, show = FALSE, defvar.row = 1,
    cache \(=\) new.env(parent \(=\) emptyenv()), cacheBack = FALSE)
mxEvalByName(name, model, compute = FALSE, show = FALSE, defvar. row = 1,
        cache \(=\) new.env (parent \(=\) emptyenv()), cacheBack \(=\) FALSE)
```

## Arguments

| expression | An arbitrary R expression. |
| :--- | :--- |
| model | The model in which to evaluate the expression. |
| compute | If TRUE then compute the value of algebra expressions. |
| show | If TRUE then print the translated expression. |
| defvar. row | The row number for definition variables when compute=TRUE. |
| cache | An R environment of matrix values used to speedup computation. |
| cacheBack | If TRUE then return the list pair (value, cache). |
| name | The character name of an object to evaluate. |

## Details

The argument 'expression' is an arbitrary R expression. Any named entities that are used within the R expression are translated into their current value from the model. Any labels from the matrices within the model are translated into their current value from the model. Finally the expression is evaluated and the result is returned. To enable debugging, the 'show' argument has been provided. The most common mistake when using this function is to include named entities in the model that are identical to R function names. For example, if a model contains a named entity named ' $c$ ', then the following mxEval call will return an error: mxEval (c (A, B, C), model).
The mxEvalByName function is a wrapper around mxEval that takes a character instead of an $R$ expression.
If 'compute' is FALSE, then MxAlgebra expressions return their current values as they have been computed by the optimization call (using mxRun). If the 'compute' argument is TRUE, then MxAlgebra expressions will be calculated in R. Any references to an objective function that has not yet been calculated will return a $1 \times 1$ matrix with a value of NA.
The 'cache' is used to speedup calculation by storing previously computing values. The cache is a list of matrices, such that names(cache) must all be of the form "modelname.entityname". Setting 'cacheBack' to TRUE will return the pair list(value, cache) where value is the result of the mxEval() computation and cache is the updated cache.

## See Also

mxAlgebra to create algebraic expressions inside your model and mxModel for the model object mxEval looks inside when evaluating.

## Examples

```
library(OpenMx)
# Set up a 1x1 matrix
matrixA <- mxMatrix("Full", nrow = 1, ncol = 1, values = 1, name = "A")
# Set up an algebra
algebraB <- mxAlgebra(A + A, name = "B")
# Put them both in a model
testModel <- mxModel(model="testModel", matrixA, algebraB)
# Even though the model has not been run, we can evaluate the algebra
# given the starting values in matrixA.
mxEval(B, testModel, compute=TRUE)
# If we just print the algebra, we can see it has not been evaluated
testModel$B
```

MxExpectation-class MxExpectation

## Description

This is an internal class and should not be used directly.

```
mxExpectationBA81 Create a Bock & Aitkin (1981) expectation
```

## Description

When a two-tier covariance matrix is recognized, this expectation automatically enables analytic dimension reduction (Cai, 2010).

## Usage

mxExpectationBA81(ItemSpec, item = "item", ..., qpoints $=49 \mathrm{~L}$, qwidth $=6$, mean = "mean", cov = "cov", verbose = 0L, weightColumn = NA_integer_, EstepItem $=$ NULL, debugInternal $=$ FALSE)

## Arguments

| ItemSpec | a single item model (to replicate) or a list of item models in the same order as the column of ItemParam |
| :---: | :---: |
| item | the name of the mxMatrix holding item parameters with one column for each item model with parameters starting at row 1 and extra rows filled with NA |
|  | Not used. Forces remaining arguments to be specified by name. |
| qpoints | number of points to use for equal interval quadrature integration (default 49L) |
| qwidth | the width of the quadrature as a positive Z score (default 6.0) |
| mean | the name of the mxMatrix holding the mean vector |
| cov | the name of the mxMatrix holding the covariance matrix |
| verbose | the level of runtime diagnostics (default 0L) |
| weightColumn | the name of the column in the data containing the row weights (default NA) |
| EstepItem | a simple matrix of item parameters for the E-step. This option is mainly of use for debugging derivatives. |
| debugInternal | when enabled, some of the internal tables are returned in \$debug. This is mainly of use to developers. |

## Details

The standard Normal distribution of the quadrature acts like a prior distribution for difficulty. It is not necessary to impose any additional Bayesian prior on difficulty estimates (Baker \& Kim, 2004, p. 196).

RPF
mxExpectationGREML Create MxExpectationGREML Object

## Description

This function creates a new MxExpectationGREML object.

## Usage

mxExpectationGREML(V, yvars=character(0), Xvars=list(), addOnes=TRUE, blockByPheno=TRUE, staggerZeroes=TRUE, dataset.is.yX=FALSE, casesToDropFromV=integer(0))

## Arguments

V
Character string; the name of the MxAlgebra or MxMatrix to serve as the ' $V$ ' matrix (the model-expected covariance matrix).
yvars, Xvars, addOnes, blockByPheno, staggerZeroes Passed to mxGREMLDataHandler ().
dataset.is.yX Logical; defaults to FALSE. If TRUE, then the first column of the raw dataset is taken as-is to be the 'y' phenotype vector, and the remaining columns are taken as-is to be the ' X ' matrix of covariates. In this case, mxGREMLDataHandler () is never internally called at runtime, and all other arguments besides $V$ and casesToDropFromV are ignored.
casesToDropFromV
Integer vector. Its elements are the numbers of the rows and columns of covariance matrix 'V' to be dropped at runtime, usually because they correspond to rows of ' y ' or ' X ' that contained missing observations. By default, no cases are dropped from 'V.' Ignored unless dataset. is. $y X=T R U E$.

## Details

"GREML" stands for "genomic-relatedness-matrix restricted maximum-likelihood." In the strictest sense of the term, it refers to genetic variance-component estimation from matrices of subjects' pairwise degree of genetic relatedness, as calculated from genome-wide marker data. It is from this original motivation that some of the terminology originates, such as calling 'y' the "phenotype" vector. However, OpenMx's implementation of GREML is applicable for analyses from any subject-matter domain, and in which the following assumptions are reasonable:

1. Conditional on ' X ' (the covariates), the phenotype vector (response variable) ' y ' is a single realization from a multivariate-normal distribution having (in general) a dense covariance matrix, 'V.'
2. The parameters of the covariance matrix, such as variance components, are of primary interest.
3. The random effects are normally distributed.
4. Weighted least-squares regression, using the inverse of ' $V$ ' as a weight matrix, is an adequate model for the phenotypic means. Note that the regression coefficients are not actually free parameters to be numerically optimized.

Computationally, the chief distinguishing feature of an OpenMx GREML analysis is that the phenotype vector, 'y,' is a single realization of a random vector that, in general, cannot be partitioned into independent subvectors. For this reason, definition variables are not compatible (and should be unnecessary with) GREML expectation. GREML expectation can still be used if the covariance matrix is sparse, but as of this writing, OpenMx does not take advantage of the sparseness to improved performance. Because of the limitations of restricted maximum likelihood, GREML expectation is presently incompatible with ordinal variables.

## Value

Returns a new object of class MxExpectationGREML.

## References

MxExpectationGREML-class
Class "MxExpectationGREML"

## Description

MxExpectationGREML is a type of expectation class. It contains the necessary elements for specifying a GREML model. For more information, see mxExpectationGREML().

## Objects from the Class

Objects can be created by calls of the form mxExpectationGREML(V,yvars, Xvars, addOnes, blockByPheno,

## Slots

V: Object of class "MxCharOrNumber". Identifies the MxAlgebra or MxMatrix to serve as the 'V' matrix.
yvars: Character vector. Each string names a column of the raw dataset, to be used as a phenotypes.
Xvars: A list of data column names, specifying the covariates to be used with each phenotype.
addOnes: Logical; pertains to data-handling at runtime.
blockByPheno: Logical; pertains to data-handling at runtime.
staggerZeroes: Logical; pertains to data-handling at runtime.
dataset.is.yX: Logical; pertains to data-handling at runtime.
y : Object of class "MxData". Its observed slot will contain the phenotype vector, 'y.'
$X$ : A matrix, to contain the ' X ' matrix of covariates.
yXcolnames: Character vector; used to store the column names of ' $y$ ' and ' $X$.'
casesToDrop: Integer vector, specifying the rows and columns of the ' $V$ ' matrix to be removed at runtime.
b: A matrix, to contain the vector of regression coefficients calculated at runtime.
bcov: A matrix, to contain the sampling covariance matrix of the regression coefficients calculated at runtime.
numFixEff: Integer number of covariates in 'X.'
dims: Object of class "character".
definitionVars: Object of class "list".
numStats: Numeric; number of observed statistics.
dataColumns: Object of class "numeric".
name: Object of class "character".
data: Object of class "MxCharOrNumber".
submodels: Object of class "MxOptionalCharOrNumber".
container: Object of class "MxOptionalCharOrNumber".
.runDims: Object of class "character".

## Extends

Class "MxBaseExpectation", directly. Class "MxBaseNamed", by class "MxBaseExpectation", distance 2. Class "MxExpectation", by class "MxBaseExpectation", distance 2.

## Methods

No methods defined with class "MxExpectationGREML" in the signature.

## References

mxExpectationLISREL Create MxExpectationLISREL Object

## Description

This function creates a new MxExpectationLISREL object.

## Usage

mxExpectationLISREL (LX=NA, LY=NA, BE=NA, GA=NA, PH=NA, PS=NA, TD=NA, TE=NA, TH=NA, $T X=N A, T Y=N A, K A=N A, A L=N A$, dimnames $=$ NA, thresholds $=$ NA, threshnames $=$ dimnames)

## Arguments

LX
LY
An optional character string indicating the name of the 'LX' matrix.

BE
GA
PH
PS
TD
TE
An optional character string indicating the name of the 'LY' matrix.
An optional character string indicating the name of the ' BE ' matrix.
An optional character string indicating the name of the 'GA' matrix.
An optional character string indicating the name of the ' PH ' matrix.
An optional character string indicating the name of the 'PS' matrix.
An optional character string indicating the name of the 'TD' matrix.
An optional character string indicating the name of the 'TE' matrix.
mxExpectationLISREL

| TH | An optional character string indicating the name of the ' TH ' matrix. |
| :--- | :--- |
| TX | An optional character string indicating the name of the ' TX ' matrix. |
| TY | An optional character string indicating the name of the ' TY ' matrix. |
| KA | An optional character string indicating the name of the ' KA ' matrix. |
| AL | An optional character string indicating the name of the 'AL' matrix. |
| dimnames | An optional character vector that is currently ignored |
| thresholds | An optional character string indicating the name of the thresholds matrix. |
| threshnames | An optional character vector to be assigned to the column names of the thresh- <br> olds matrix. |

## Details

Expectation functions define the way that model expectations are calculated. The mxExpectationLISREL calculates the expected covariance and means of a given MxData object given a LISREL model. This model is defined by LInear Structual RELations (LISREL; Jöreskog \& Sörbom, 1982, 1996). Arguments 'LX' through 'AL' must refer to MxMatrix objects with the associated properties of their respective matrices in the LISREL modeling approach.
The full LISREL specification has 13 matrices and is sometimes called the extended LISREL model. It is defined by the following equations.

$$
\begin{gathered}
\eta=\alpha+B \eta+\Gamma \xi+\zeta \\
y=\tau_{y}+\Lambda_{y} \eta+\epsilon \\
x=\tau_{x}+\Lambda_{x} \xi+\delta
\end{gathered}
$$

The table below is provided as a quick reference to the numerous matrices in LISREL models. Note that NX is the number of manifest exogenous (independent) variables, the number of Xs. NY is the number of manifest endogenous (dependent) variables, the number of Ys. NK is the number of latent exogenous variables, the number of Ksis or Xis. NE is the number of latent endogenous variables, the number of etas.

| Matrix | Word |
| :---: | :--- |
| $\Lambda_{x}$ | Lambda x |
| $\Lambda_{y}$ | Lambda y |
| $B$ | Beta |
| $\Gamma$ | Gamma |
| $\Phi$ | Phi |
| $\Psi$ | Psi |
| $\Theta_{\delta}$ | Theta delta |
| $\Theta_{\epsilon}$ | Theta epsilon |
| $\Theta_{\delta \epsilon}$ | Theta delta epsilson |
| $\tau_{x}$ | tau x |
| $\tau_{y}$ | tau y |
| $\kappa$ | kappa |
| $\alpha$ | alpha |

| Abbreviation | Dimensions | Expression | Description |
| :---: | :---: | :---: | :--- |
| LX | NX x NK |  | Exogenous Factor Loading Matrix |
| LY | NY x NE |  | Endogenous Factor Loading Matrix |
| BE | NE x NE |  | Regressions of Latent Endogenous Variables Pre |
| GA | NE x NK |  | Regressions of Latent Exogenous Variables Pred |
| PH | NK x NK | $\operatorname{cov}(\xi)$ | Covariance Matrix of Latent Exogenous Variable |
| PS | NE xE | $\operatorname{cov}(\zeta)$ | Residual Covariance Matrix of Latent Endogeno |
| TD | NX x NX | $\operatorname{cov}(\delta)$ | Residual Covariance Matrix of Manifest Exogen |
| TE | NY x NY | $\operatorname{cov}(\epsilon)$ | Residual Covariance Matrix of Manifest Endoge |
| TH | NX x NY | $\operatorname{cov}(\delta, \epsilon)$ | Residual Covariance Matrix of Manifest Exogen |
| TX | NX x 1 |  | Residual Means of Manifest Exogenous Variable |
| TY | NY x 1 |  | Residual Means of Manifest Endogenous Variabl |
| KA | NK x 1 | $\operatorname{mean}(\xi)$ | Means of Latent Exogenous Variables |
| AL | NEx 1 |  | Residual Means of Latent Endogenous Variables |

From the extended LISREL model, several submodels can be defined. Subtypes of the LISREL model are defined by setting some of the arguments of the LISREL expectation function to NA. Note that because the default values of each LISREL matrix is NA, setting a matrix to NA can be accomplished by simply not giving it any other value.
The first submodel is the LISREL model without means.

$$
\begin{gathered}
\eta=B \eta+\Gamma \xi+\zeta \\
y=\Lambda_{y} \eta+\epsilon \\
x=\Lambda_{x} \xi+\delta
\end{gathered}
$$

The LISREL model without means requires 9 matrices: LX, LY, BE, GA, PH, PS, TD, TE, and TH. Hence this LISREL model has TX, TY, KA, and AL as NA. This can be accomplished be leaving these matrices at their default values.
The TX, TY, KA, and AL matrices must be specified if either the mxData type is "cov" or "cor" and a means vector is provided, or if the mxData type is "raw". Otherwise the TX, TY, KA, and AL matrices are ignored and the model without means is estimated.
A second submodel involves only endogenous variables.

$$
\begin{gathered}
\eta=B \eta+\zeta \\
y=\Lambda_{y} \eta+\epsilon
\end{gathered}
$$

The endogenous-only LISREL model requires 4 matrices: LY, BE, PS, and TE. The LX, GA, PH, TD, and TH must be NA in this case. However, means can also be specified, allowing TY and AL if the data are raw or if observed means are provided.

Another submodel involves only exogenous variables.

$$
x=\Lambda_{x} \xi+\delta
$$

The exogenous-model model requires 3 matrices: LX, PH, and TD. The LY, BE, GA, PS, TE, and TH matrices must be NA. However, means can also be specified, allowing TX and KA if the data are raw or if observed means are provided.
The model that is run depends on the matrices that are not NA. If all 9 matrices are not NA, then the full model is run. If only the 4 endogenous matrices are not NA, then the endogenous-only model is run. If only the 3 exogenous matrices are not NA, then the exogenous-only model is run. If some endogenous and exogenous matrices are not NA, but not all of them, then appropriate errors are thrown. Means are included in the model whenever their matrices are provided.
The MxMatrix objects included as arguments may be of any type, but should have the properties described above. The mxExpectationLISREL will not return an error for incorrect specification, but incorrect specification will likely lead to estimation problems or errors in the mxRun function.

Like the mxExpectationRAM, the mxExpectationLISREL evaluates with respect to an MxData object. The MxData object need not be referenced in the mxExpectationLISREL function, but must be included in the MxModel object. mxExpectationLISREL requires that the 'type' argument in the associated MxData object be equal to 'cov', 'cor', or 'raw'.

To evaluate, place mxExpectationLISREL objects, the mxData object for which the expected covariance approximates, referenced MxAlgebra and MxMatrix objects, and optional MxBounds and MxConstraint objects in an MxModel object. This model may then be evaluated using the mxRun function. The results of the optimization can be found in the 'output' slot of the resulting model, and may be obtained using the mxEval function.

## Value

Returns a new MxExpectationLISREL object. One and only one MxExpectationLISREL object can be included with models using one and only one fit function object (e.g., MxFitFunctionML) and with referenced MxAlgebra, MxData and MxMatrix objects.

mxExpectationNormal Create MxExpectationNormal Object

## Description

This function creates an MxExpectationNormal object.

## Usage

mxExpectationNormal(covariance, means, dimnames = NA, thresholds = NA, threshnames = dimnames)

## Arguments

covariance A character string indicating the name of the expected covariance algebra.
means A character string indicating the name of the expected means algebra.
dimnames An optional character vector to be assigned to the dimnames of the covariance and means algebras.
thresholds An optional character string indicating the name of the thresholds matrix.
threshnames An optional character vector to be assigned to the column names of the thresholds matrix.

## Details

Expectation functions define the way that model expectations are calculated. The mxExpectationNormal function uses the algebra defined by the 'covariance' and 'means' arguments to define the expected covariance and means under the assumption of multivariate normality. The 'covariance' argument takes an MxAlgebra object, which defines the expected covariance of an associated MxData object. The 'means' argument takes an MxAlgebra object, which defines the expected means of an associated MxData object. The 'dimnames' arguments takes an optional character vector. If this argument is not a single NA, then this vector is used to assign the dimnames of the means vector as well as the row and columns dimnames of the covariance matrix.
thresholds: The name of the thresholds matrix. When needed (for modelling ordinal data), this matrix should be created using mxMatrix(). The thresholds matrix must have as many columns as there are ordinal variables in the model, and number of rows equal to one fewer than the maximum number of levels found in the ordinal variables. The starting values of this matrix must also be set to reasonable values. Fill each column with a set of ordered start thresholds, one for each level of this column's factor levels minus 1. These thresholds may be free if you wish them to be estimated, or fixed. The unused rows in each column, if any, can be set to any value including NA.
threshnames: A character vector consisting of the variables in the thresholds matrix, i.e., the names of ordinal variables in a model. This is necessary for OpenMx to map the thresholds matrix columns onto the variables in your data. If you set the dimnames of the columns in the thresholds matrix then threshnames is not needed.

Usage Notes: dimnames must be supplied where the matrices referenced by the covariance and means algebras are not themselves labeled. Failure to do so leads to an error noting that the covariance or means matrix associated with the FIML objective does not contain dimnames.
mxExpectationNormal evaluates with respect to an MxData object. The MxData object need not be referenced in the mxExpectationNormal function, but must be included in the MxModel object. When the 'type' argument in the associated MxData object is equal to 'raw', missing values are permitted in the associated MxData object.

To evaluate, place an mxExpectationNormal object, the mxData object for which the expected covariance approximates, referenced MxAlgebra and MxMatrix objects, optional MxBounds or MxConstraint objects, and an mxFitFunction such as mxFitFunctionML in an MxModel object. This model may then be evaluated using the mxRun function.
The results of the optimization can be reported using the summary function, or accessed directly in the 'output' slot of the resulting model (i.e., modelName\$output). Components of the output may be referenced using the Extract functionality.

## Value

Returns an MxExpectationNormal object.

## References

# Simulate some data
x=rnorm(1000, mean=0, sd=1)
y=0.5*x + rnorm(1000, mean=0, sd=1)
tmpFrame <- data.frame(x, y)
tmpNames <- names(tmpFrame)
# Define the matrices
M <- mxMatrix(type = "Full", nrow = 1, ncol = 2, values=c(0,0),
    free=c(TRUE,TRUE), labels=c("Mx", "My"), name = "M")
S <- mxMatrix(type = "Full", nrow = 2, ncol = 2, values=c(1,0,0,1),
    free=c(TRUE,FALSE,FALSE,TRUE), labels=c("Vx", NA, NA, "Vy"),
    name = "S")
A <- mxMatrix(type = "Full", nrow = 2, ncol = 2, values=c(0,1,0,0),
    free=c(FALSE,TRUE,FALSE,FALSE), labels=c(NA, "b", NA, NA),
    name = "A")
I <- mxMatrix(type="Iden", nrow=2, ncol=2, name="I")
```

```
# Define the expectation
expCov <- mxAlgebra(solve(I-A) %*% S %*% t(solve(I-A)), name="expCov")
expFunction <- mxExpectationNormal(covariance="expCov", means="M",
dimnames=tmpNames)
# Choose a fit function
fitFunction <- mxFitFunctionML()
# Define the model
tmpModel <- mxModel(model="exampleModel", M, S, A, I,
    expCov, expFunction, fitFunction,
    mxData(observed=tmpFrame, type="raw"))
# Fit the model and print a summary
tmpModelOut <- mxRun(tmpModel)
summary(tmpModelOut)
```

mxExpectationRAM Create an MxExpectationRAM Object

## Description

This function creates an MxExpectationRAM object.

## Usage

$m x E x p e c t a t i o n R A M(A=" A ", S=" S ", F=" F ", M=N A$, dimnames = NA, thresholds = NA, threshnames = dimnames)

## Arguments

A
S
thresholds
threshnames

F A character string indicating the name of the ' $F$ ' matrix.
M An optional character string indicating the name of the ' $M$ ' matrix.
dimnames An optional character vector to be assigned to the column names of the ' F ' and ' M ' matrices.
A character string indicating the name of the ' $A$ ' matrix.
A character string indicating the name of the 'S' matrix.

An optional character string indicating the name of the thresholds matrix.
An optional character vector to be assigned to the column names of the thresholds matrix.

## Details

Expectation functions define the way that model expectations are calculated. The mxExpectationRAM calculates the expected covariance and means of a given MxData object given a RAM model. This model is defined by reticular action modeling (McArdle and McDonald, 1984). The 'A', 'S', and ' $F$ ' arguments must refer to MxMatrix objects with the associated properties of the A, S, and F matrices in the RAM modeling approach.

The 'dimnames' arguments takes an optional character vector. If this argument is not a single NA, then this vector be assigned to be the column names of the ' F ' matrix and optionally to the ' M ' matrix, if the 'M' matrix exists.

The 'A' argument refers to the A or asymmetric matrix in the RAM approach. This matrix consists of all of the asymmetric paths (one-headed arrows) in the model. A free parameter in any row and column describes a regression of the variable represented by that row regressed on the variable represented in that column.

The 'S' argument refers to the $S$ or symmetric matrix in the RAM approach, and as such must be square. This matrix consists of all of the symmetric paths (two-headed arrows) in the model. A free parameter in any row and column describes a covariance between the variable represented by that row and the variable represented by that column. Variances are covariances between any variable at itself, which occur on the diagonal of the specified matrix.

The ' $F$ ' argument refers to the F or filter matrix in the RAM approach. If no latent variables are included in the model (i.e., the A and S matrices are of both of the same dimension as the data matrix), then the ' $F$ ' should refer to an identity matrix. If latent variables are included (i.e., the A and S matrices are not of the same dimension as the data matrix), then the ' $F$ ' argument should consist of a horizontal adhesion of an identity matrix and a matrix of zeros.

The ' M ' argument refers to the M or means matrix in the RAM approach. It is a 1 xn matrix, where n is the number of manifest variables + the number of latent variables. The M matrix must be specified if either the mxData type is "cov" or "cor" and a means vector is provided, or if the mxData type is "raw". Otherwise the M matrix is ignored.

The MxMatrix objects included as arguments may be of any type, but should have the properties described above. The mxExpectationRAM will not return an error for incorrect specification, but incorrect specification will likely lead to estimation problems or errors in the mxRun function.
mxExpectationRAM evaluates with respect to an MxData object. The MxData object need not be referenced in the mxExpectationRAM function, but must be included in the MxModel object.

To evaluate, place mxExpectationRAM objects, the mxData object for which the expected covariance approximates, referenced MxAlgebra and MxMatrix objects, and optional MxBounds and MxConstraint objects in an MxModel object. This model may then be evaluated using the mxRun function. The results of the optimization can be found in the 'output' slot of the resulting model, and may be obtained using the mxEval function..

## Value

Returns a new MxExpectationRAM object. mxExpectationRAM objects should be included with models with referenced MxAlgebra, MxData and MxMatrix objects.

mxExpectationStateSpace

> Create an MxExpectationStateSpace Object

## Description

This function creates a new MxExpectationStateSpace object.

## Usage

```
mxExpectationStateSpace(A, B, C, D, Q, R, x0, P0, u,
                                    dimnames = NA, thresholds = NA, threshnames = dimnames,
                        \(\ldots, t=N A\) )
```

## Arguments

A A character string indicating the name of the 'A' matrix.
B A character string indicating the name of the ' $B$ ' matrix.
C A character string indicating the name of the ' $C^{\prime}$ matrix.
D A character string indicating the name of the ' $D$ ' matrix.
Q A character string indicating the name of the ' $Q$ ' matrix.
$R \quad$ A character string indicating the name of the ' $R$ ' matrix.
$x 0 \quad$ A character string indicating the name of the ' $x 0$ ' matrix.
P0 A character string indicating the name of the ' P 0 ' matrix.
$u \quad$ A character string indicating the name of the 'u' matrix.
dimnames An optional character vector to be assigned to the row names of the ' C ' matrix.
thresholds Not Yet Implemented. An optional character string indicating the name of the thresholds matrix.
threshnames Not Yet Implemented. An optional character vector to be assigned to the column names of the thresholds matrix.
... Unused. Requires further arguments to be named.
t Not to be used

## Details

Expectation functions define the way that model expectations are calculated. When used in conjunction with the mxFitFunctionML, the mxExpectationStateSpace uses maximum likelihood prediction error decomposition (PED) to obtain estimates of free parameters in a model of the raw MxData object. State space expectations treat the raw data as a multivariate time series of equally spaced times with each row corresponding to a single occasion. This is not a model of the block Toeplitz lagged autocovariance matrix. State space expectations implement a classical Kalman filter to produce expectations.

The hybrid Kalman filter (combination of classical Kalman and Kalman-Bucy filters) for continuous latent time with discrete observations is implemented and is available as mxExpectationStateSpaceContinuousTime. The following alternative filters are not yet implemented: square root Kalman filter (in Cholesky or singular value decomposition form), extended Kalman filter for linear approximations to nonlinear state space models, unscented Kalman filter for highly nonlinear state space models, and Rauch-Tung-Striebel smoother for updating forecast state estimates after a complete forward pass through the data has been made.
Missing data handling is implemented in the same fashion as full information maximum likelihood for partially missing rows of data. Additionally, completely missing rows of data are handled by only using the prediction step from the Kalman filter and omitting the update step.
This model uses notation for the model matrices commonly found in engineering and control theory.
The 'A', 'B', 'C', 'D', 'Q', 'R', 'x0', and 'P0' arguments must be the names of MxMatrix or MxAlgebraobjects with the associated properties of the $\mathrm{A}, \mathrm{B}, \mathrm{C}, \mathrm{D}, \mathrm{Q}, \mathrm{R}, \mathrm{x} 0$, and P 0 matrices in the state space modeling approach.
The state space expectation is defined by the following model equations.

$$
\begin{gathered}
x_{t}=A x_{t-1}+B u_{t}+q_{t} \\
y_{t}=C x_{t}+D u_{t}+r_{t}
\end{gathered}
$$

with $q_{t}$ and $r_{t}$ both independently and identically distributed random Gaussian (normal) variables with mean zero and covariance matrices $Q$ and $R$, respectively.

The first equation is called the state equation. It describes how the latent states change over time. Also, the state equation in state space modeling is directly analogous to the structural model in LISREL structural equation modeling.
The second equation is called the output equation. It describes how the latent states relate to the observed states at a single point in time. The output equation shows how the observed output is produced by the latent states. Also, the output equation in state space modeling is directly analogous to the measurement model in LISREL structural equation modeling.
Note that the covariates, $u$, have "instantaneous" effects on both the state and output equations. If lagged effects are desired, then the user must create a lagged covariate by shifting their observed variable to the desired lag.
The state and output equations, together with some minimal assumptions and the Kalman filter, imply a new expected covariance matrix and means vector for every row of data. The expected covariance matrix of row $t$ is

$$
S_{t}=C\left(A P_{t-1} A^{\top}+Q\right) C^{\top}+R
$$

The expected means vector of row $t$ is

$$
\hat{y}_{t}=C x_{t}+D u_{t}
$$

The 'dimnames' arguments takes an optional character vector.
The 'A' argument refers to the $A$ matrix in the State Space approach. This matrix consists of time regressive coefficients from the latent variable in column $j$ at time $t-1$ to the latent variable in row
$i$ at time $t$. Entries in the diagonal are autoregressive coefficients. Entries in the off-diagonal are cross-lagged regressive coefficients. If the $A$ and $B$ matrices are zero matrices, then the state space model reduces to a factor analysis. The $A$ matrix is sometimes called the state-transition model.
The 'B' argument refers to the $B$ matrix in the State Space approach. This matrix consists of regressive coefficients from the input (manifest covariate) variable $j$ at time $t$ to the latent variable in row $i$ at time $t$. Note that the covariate effect is contemporaneous: the covariate at time $t$ has influence on the latent state also at time $t$. A lagged effect can be created by lagged the observed variable. The $B$ matrix is sometimes called the control-input model.
The ' C ' argument refers to the $C$ matrix in the State Space approach. This matrix consists of contemporaneous regression coefficients from the latent variable in column $j$ to the observed variable in row $i$. This matrix is directly analogous to the factor loadings matrix in LISREL and Mplus models. The $C$ matrix is sometimes called the observation model.
The 'D' argument refers to the $D$ matrix in the State Space approach. This matrix consists of contemporaneous regressive coefficients from the input (manifest covariate) variable $j$ to the observed variable in row $i$. The $D$ matrix is sometimes called the feedthrough or feedforward matrix.
The 'Q' argument refers to the $Q$ matrix in the State Space approach. This matrix consists of residual covariances among the latent variables. This matrix must be symmetric. As a special case, it is often diagonal. The $Q$ matrix is the covariance of the process noise. Just as in factor analysis and general structural equation modeling, the scale of the latent variables is usually set by fixing some factor loadings in the $C$ matrix, or fixing some factor variances in the $Q$ matrix.
The ' R ' argument refers to the $R$ matrix in the State Space approach. This matrix consists of residual covariances among the observed (manifest) variables. This matrix must be symmetric As a special case, it is often diagonal. The $R$ matrix is the covariance of the observation noise.
The 'x0' argument refers to the $x_{0}$ matrix in the State Space approach. This matrix consists of the column vector of the initial values for the latent variables. The state space expectation uses the $x_{0}$ matrix as the starting point to recursively estimate the latent variables' values at each time. These starting values can be difficult to pick, however, for sufficiently long time series they often do not greatly impact the estimation.
The 'P0' argument refers to the $P_{0}$ matrix in the State Space approach. This matrix consists of the initial values of the covariances of the error in the initial latent variable estimates given in $x_{0}$. That is, the $P_{0}$ matrix gives the covariance of $x_{0}-x t r u e_{0}$ where $x t r u e_{0}$ is the vector of true initial values. $P_{0}$ is a measure of the accuracy of the intial latent state estimates. The Kalman filter uses this initial covariance to recursively generated a new covariance for each time point based on the previous time point. The Kalman filter updates this covariance so that it is as small as possible (minimum trace). Similar to the $x_{0}$ matrix, these starting values are often difficult to choose.
The 'u' argument refers to the $u$ matrix in the State Space approach. This matrix consists of the inputs or manifest covariates of the state space expectation. The $u$ matrix must be a column vector with the same number of rows as the $B$ and $D$ matrices have columns. If no inputs are desired, $u$ can be a zero matrix. If time-varying inputs are desired, then they should be included as columns in the MxData object and referred to in the labels of the $u$ matrix as definition variables. There is an example of this below.
The MxMatrix objects included as arguments may be of any type, but should have the properties described above. The mxExpectationStateSpace will not return an error for incorrect specification, but incorrect specification will likely lead to estimation problems or errors in the mxRun function.
mxExpectationStateSpace evaluates with respect to an MxData object. The MxData object need not be referenced in the mxExpectationStateSpace function, but must be included in the MxModel
object. mxExpectationStateSpace requires that the 'type' argument in the associated MxData object be equal to 'raw'. Neighboring rows of the MxData object are treated as adjacent, equidistant time points increasing from the first to the last row.
To evaluate, place mxExpectationStateSpace objects, the mxData object for which the expected covariance approximates, referenced MxAlgebra and MxMatrix objects, and optional MxBounds and MxConstraint objects in an MxModel object. This model may then be evaluated using the mxRun function. The results of the optimization can be found in the 'output' slot of the resulting model, and may be obtained using the mxEval function.

## Value

Returns a new MxExpectationStateSpace object. mxExpectationStateSpace objects should be included with models with referenced MxAlgebra, MxData and MxMatrix objects.

C A character string indicating the name of the ' C ' matrix.
D
Q A character string indicating the name of the ' Q ' matrix.
R
x 0
P0
u
t
dimnames
thresholds
A character string indicating the name of the ' A ' matrix.

A character string indicating the name of the ' $D$ ' matrix.

A character string indicating the name of the ' R ' matrix.
A character string indicating the name of the ' x 0 ' matrix.
A character string indicating the name of the 'P0' matrix.
A character string indicating the name of the 'u' matrix.
A character string indicating the name of the ' $t$ ' matrix.
An optional character vector to be assigned to the row names of the 'C' matrix.
Not Yet Implemented. An optional character string indicating the name of the thresholds matrix.
threshnames Not Yet Implemented. An optional character vector to be assigned to the column names of the thresholds matrix.

## Details

The mxExpectationStateSpaceContinuousTime and mxExpectationSSCT functions are identical. The latter is simply an abbreviated name. When using the former, tab completion is strongly encouraged to save tedious typing. Both of these functions are wrappers for the mxExpectationStateSpace function, which could be used for both discrete and continuous time modeling. However, there is a strong possibility of misunderstanding the model parameters when switching between discrete time and continuous time. The expectation matrices have the same names, but mean importantly different things so caution is warranted. The best practice is to use mxExpectationStateSpace for discrete time models, and mxExpectationStateSpaceContinuousTime for continuous time models.

Expectation functions define the way that model expectations are calculated. That is to say, expectation functions define how a set of model matrices get turned into expectations for the data. When used in conjunction with the mxFitFunctionML, the mxExpectationStateSpace uses maximum likelihood prediction error decomposition (PED) to obtain estimates of free parameters in a model of the raw MxData object. Continuous time state space expectations treat the raw data as a multivariate time series of possibly unevenly spaced times with each row corresponding to a single occasion. Continuous time state space expectations implement a hybrid Kalman filter to produce expectations. The hybrid Kalman filter uses a Kalman-Bucy filter for the prediction step and the classical Kalman filter for the update step. It is a hybrid between the classical Kalman filter used for the discrete (but possibly unequally spaced) measurement occastions and the continous time Kalman-Bucy filter for latent variable predictions.

Missing data handling is implemented in the same fashion as full information maximum likelihood for partially missing rows of data. Additionally, completely missing rows of data are handled by only using the prediction step from the Kalman-Bucy filter and omitting the update step.
This model uses notation for the model matrices commonly found in engineering and control theory.
The 'A', 'B', 'C', 'D', 'Q', 'R', 'x0', and 'P0' arguments must be the names of MxMatrix or MxAlgebraobjects with the associated properties of the $\mathrm{A}, \mathrm{B}, \mathrm{C}, \mathrm{D}, \mathrm{Q}, \mathrm{R}, \mathrm{x} 0$, and P0 matrices in the state space modeling approach. The ' $t$ ' matrix must be a 1 x 1 matrix using definition variables that gives the times at which measurements occurred.
The state space expectation is defined by the following model equations.

$$
\begin{aligned}
\frac{d}{d t} x(t) & =A x(t)+B u_{t}+q(t) \\
y_{t} & =C x_{t}+D u_{t}+r_{t}
\end{aligned}
$$

with $q(t)$ and $r_{t}$ both independently and identically distributed random Gaussian (normal) variables with mean zero and covariance matrices $Q$ and $R$, respectively. Subscripts or square brackets indicate discrete indices; parentheses indicate continuous indices. The derivative of $x(t)$ with respect to $t$ is $\frac{d}{d t} x(t)$.
The first equation is called the state equation. It describes how the latent states change over time with a first-order linear differential equation.
The second equation is called the output equation. It describes how the latent states relate to the observed states at a single point in time. The output equation shows how the observed output is produced by the latent states. Also, the output equation in state space modeling is directly analogous to the measurement model in LISREL structural equation modeling.
Note that the covariates, $u$, have "instantaneous" effects on both the state and output equations. If lagged effects are desired, then the user must create a lagged covariate by shifting their observed variable to the desired lag.
The state and output equations, together with some minimal assumptions and the Kalman filter, imply a new expected covariance matrix and means vector for every row of data. The expected covariance matrix of row $t$ is

$$
S_{t}=C\left(A P_{t-1} A^{\top}+Q\right) C^{\top}+R
$$

The expected means vector of row $t$ is

$$
\hat{y}_{t}=C x_{t}+D u_{t}
$$

The 'dimnames' arguments takes an optional character vector.
The 'A' argument refers to the $A$ matrix in the State Space approach. This matrix gives the dynamics. Entries in the diagonal give the strength of the influence of a variable's position on its slope. Entries in the off-diagonal give the coupling strength from one variable to another. The $A$ matrix is sometimes called the state-transition model.

The ' B ' argument refers to the $B$ matrix in the State Space approach. This matrix consists of exogenous forces that influence the dynamics. Note that the covariate effect is contemporaneous: the covariate at time $t$ has influence on the slope of the latent state also at time $t$. A lagged effect
can be created by lagged the observed variable. The $B$ matrix is sometimes called the control-input model.
The ' $C$ ' argument refers to the $C$ matrix in the State Space approach. This matrix consists of contemporaneous regression coefficients from the latent variable in column $j$ to the observed variable in row $i$. This matrix is directly analogous to the factor loadings matrix in LISREL and Mplus models. The $C$ matrix is sometimes called the observation model.
The 'D' argument refers to the $D$ matrix in the State Space approach. This matrix consists of contemporaneous regressive coefficients from the input (manifest covariate) variable $j$ to the observed variable in row $i$. The $D$ matrix is sometimes called the feedthrough or feedforward matrix.
The ' Q ' argument refers to the $Q$ matrix in the State Space approach. This matrix gives the covariance of the dynamic noise. The dynamic noise can be thought of as unmeasured covariate inputs active at all times. This matrix must be symmetric, diagonal, or zero. As a special case, it is often diagonal. The $Q$ matrix is the covariance of the process noise. Just as in factor analysis and general structural equation modeling, the scale of the latent variables is usually set by fixing some factor loadings in the $C$ matrix, or fixing some factor variances in the $Q$ matrix.
The ' R ' argument refers to the $R$ matrix in the State Space approach. This matrix consists of residual covariances among the observed (manifest) variables. This matrix must be symmetric As a special case, it is often diagonal. The $R$ matrix is the covariance of the observation noise.
The 'x0' argument refers to the $x_{0}$ matrix in the State Space approach. This matrix consists of the column vector of the initial values for the latent variables. The state space expectation uses the $x_{0}$ matrix as the starting point to recursively estimate the latent variables' values at each time. These starting values can be difficult to pick, however, for sufficiently long time series they often do not greatly impact the estimation.

The 'P0' argument refers to the $P_{0}$ matrix in the State Space approach. This matrix consists of the initial values of the covariances of the error in the initial latent variable estimates given in $x_{0}$. That is, the $P_{0}$ matrix gives the covariance of $x_{0}-x t r u e_{0}$ where $x t r u e_{0}$ is the vector of true initial values. $P_{0}$ is a measure of the accuracy of the intial latent state estimates. The Kalman filter uses this initial covariance to recursively generated a new covariance for each time point based on the previous time point. The Kalman filter updates this covariance so that it is as small as possible (minimum trace). Similar to the $x_{0}$ matrix, these starting values are often difficult to choose.
The 'u' argument refers to the $u$ matrix in the State Space approach. This matrix consists of the inputs or manifest covariates of the state space expectation. The $u$ matrix must be a column vector with the same number of rows as the $B$ and $D$ matrices have columns. If no inputs are desired, $u$ can be a zero matrix. If time-varying inputs are desired, then they should be included as columns in the MxData object and referred to in the labels of the $u$ matrix as definition variables. There is an example of this below.
The 't' argument refers to the $t$ matrix in the State Space approach. This matrix should be 1 x 1 (1 row and 1 column) and not free. The label for the element of this matrix should be 'data. YourTimeVariable'. The 'data' part does not change, but 'YourTimeVariable' should be a name in your data set that gives the times at which measurement happened. The units of time are up to you. Your choice of time units will influence of the values of the parameters you estimate. Also, recall that the model is given $x_{0}$ and $P_{0}$. These always happen at $t=0$. So the first row of data happens some amount of time after zero.

The MxMatrix objects included as arguments may be of any type, but should have the properties described above. The mxExpectationStateSpace will not return an error for incorrect specification, but incorrect specification will likely lead to estimation problems or errors in the mxRun function.
mxExpectationStateSpaceContinuousTime evaluates with respect to an MxData object. The MxData object need not be referenced in the mxExpectationStateSpace function, but must be included in the MxModel object. mxExpectationStateSpace requires that the 'type' argument in the associated MxData object be equal to 'raw'. Neighboring rows of the MxData object are treated as adjacent, equidistant time points increasing from the first to the last row.
To evaluate, place an mxExpectationStateSpaceContinuousTime object, the mxData object for which the expected covariance approximates, referenced MxAlgebra and MxMatrix objects, and optional MxBounds and MxConstraint objects in an MxModel object. This model may then be evaluated using the mxRun function. The results of the optimization can be found in the 'output' slot of the resulting model, and may be obtained using the mxEval function.

## Value

Returns a new MxExpectationStateSpace object. mxExpectationStateSpace objects should be included with models with referenced MxAlgebra, MxData and MxMatrix objects.

mxFactor Fail-safe Factors

## Description

This is a wrapper for the R function factor.
OpenMx requires ordinal data to be ordered. R's factor function doesn't enforce this, hence this wrapper exists to throw an error should you accidentally try and run with ordered = FALSE.

Also, the 'levels' parameter is optional in R's factor function. However, relying on the data to specify the data is foolhardy for the following reasons: The factor function will skip levels missing from the data: Specifying these in levels leaves the list of levels complete. Data will often not explore the min and max level that the user knows are possible. For these reasons this function forces you to write out all possible levels explicitly.

## Usage

mxFactor (x = character(), levels, labels = levels,
exclude $=$ NA, ordered $=$ TRUE, collapse $=$ FALSE)

## Arguments

x
levels a mandatory vector of the values that ' $x$ ' might have taken.
labels _ either_ an optional vector of labels for the levels, _or_ a character string of length 1.
exclude a vector of values to be excluded from the set of levels.
ordered logical flag to determine if the levels should be regarded as ordered (in the order given). Required to be TRUE.
collapse logical flag to determine if duplicate labels should collapsed into a single level

## Details

If ' $x$ ' is a data.frame, then all of the columns of ' $x$ ' are converted into ordered factors. If ' $x$ ' is a data.frame, then 'levels' and 'labels' may be either a list or a vector. When 'levels' is a list, then different levels are assigned to different columns of the constructed data.frame object. When 'levels' is a vector, then the same levels are assigned to all the columns of the data.frame object. The function will throw an error if 'ordered' is not TRUE or if 'levels' is missing. See factor for more information on creating ordered factors.

## Examples

```
myVar <- c("s", "t", "a", "t", "i", "s", "t", "i", "c", "s")
ff <- mxFactor(myVar, levels=letters)
# Note: letters is a built in list of all lowercase letters of the alphabet
ff
# [1] s t a t i s t i c s
# Levels: a < b < c < d < e < f < g < h < i < j < k < l < m < n < o < p< q<
# r<s < t < u < v < w < x < y < z
as.integer(ff) # the internal codes
factor(ff) # NOTE: drops the levels that do not occur.
    # mxFactor prevents you doing this unintentionally.
# This example works on a dataframe
foo <- data.frame(x=c(1:3),y=c(4:6),z=c(7:9))
# Applys one set of levels to all three columns
mxFactor(foo, c(1:9))
# Apply unique sets of levels to each variable
mxFactor(foo, list(c(1:3), c(4:6), c(7:9)))
mxFactor(foo, c(1:9), labels=c(1,1,1,2,2,2,3,3,3), collapse=TRUE)
```

mxFIMLObjective
DEPRECATED: Create MxFIMLObjective Object

## Description

WARNING: Objective functions have been deprecated as of OpenMx 2.0.
Please use mxExpectationNormal() and mxFitFunctionML() instead. As a temporary workaround, mxFIMLObjective returns a list containing an MxExpectationNormal object and an MxFitFunctionML object.

## All occurrences of

$m x F I M L O b j e c t i v e($ covariance, means, dimnames $=$ NA, thresholds $=$ NA, vector $=$ FALSE, thresh names $=$ dimnames)

Should be changed to
$m x E x p e c t a t i o n N o r m a l(c o v a r i a n c e$, means, dimnames $=$ NA, thresholds $=$ NA, threshnames $=$ dimnames) $m x F i t F u n c t i o n M L(v e c t o r ~=~ F A L S E) ~$

## Arguments

$$
\begin{array}{ll}
\text { covariance } & \text { A character string indicating the name of the expected covariance algebra. } \\
\text { means } & \text { A character string indicating the name of the expected means algebra. } \\
\text { dimnames } & \begin{array}{l}
\text { An optional character vector to be assigned to the dimnames of the covariance } \\
\text { and means algebras. }
\end{array} \\
\text { thresholds } & \begin{array}{l}
\text { An optional character string indicating the name of the thresholds matrix. }
\end{array} \\
\text { vector } & \begin{array}{l}
\text { A logical value indicating whether the objective function result is the likelihood } \\
\text { vector. }
\end{array} \\
\text { threshnames } & \begin{array}{l}
\text { An optional character vector to be assigned to the column names of the thresh- } \\
\text { olds matrix. }
\end{array}
\end{array}
$$

## Details

NOTE: THIS DESCRIPTION IS DEPRECATED. Please change to using mxExpectationNormal and $m x F i t F u n c t i o n M L$ as shown in the example below.
Objective functions were functions for which free parameter values are chosen such that the value of the objective function is minimized. The mxFIMLObjective function used full-information maximum likelihood to provide maximum likelihood estimates of free parameters in the algebra defined by the 'covariance' and 'means' arguments. The 'covariance' argument takes an MxAlgebra object, which defines the expected covariance of an associated MxData object. The 'means' argument takes an MxAlgebra object, which defines the expected means of an associated MxData object. The 'dimnames' arguments takes an optional character vector. If this argument is not a single NA, then this vector is used to assign the dimnames of the means vector as well as the row and columns dimnames of the covariance matrix.
The 'vector' argument is either TRUE or FALSE, and determines whether the objective function returns a column vector of the likelihoods, or a single $-2 *(\log$ likelihood) value.
thresholds: The name of the thresholds matrix. When needed (for modelling ordinal data), this matrix should be created using mxMatrix(). The thresholds matrix must have as many columns as there are ordinal variables in the model, and number of rows equal to one fewer than the maximum number of levels found in the ordinal variables. The starting values of this matrix must also be set to reasonable values. Fill each column with a set of ordered start thresholds, one for each level of this column's factor levels minus 1. These thresholds may be free if you wish them to be estimated, or fixed. The unused rows in each column, if any, can be set to any value including NA.
threshnames: A character vector consisting of the variables in the thresholds matrix, i.e., the names of ordinal variables in a model. This is necessary for OpenMx to map the thresholds matrix columns onto the variables in your data. If you set the dimnames of the columns in the thresholds matrix then threshnames is not needed.

Usage Notes: dimnames must be supplied where the matrices referenced by the covariance and means algebras are not themselves labeled. Failure to do so leads to an error noting that the covariance or means matrix associated with the FIML objective does not contain dimnames.
mxFIMLObjective evaluates with respect to an MxData object. The MxData object need not be referenced in the mxFIMLObjective function, but must be included in the MxModel object. mxFIMLObjective requires that the 'type' argument in the associated MxData object be equal to 'raw'. Missing values are permitted in the associated MxData object.

To evaluate, place MxFIMLObjective objects, the mxData object for which the expected covariance approximates, referenced MxAlgebra and MxMatrix objects, and optional MxBounds and MxConstraint objects in an MxModel object. This model may then be evaluated using the mxRun function.
The results of the optimization can be reported using the summary function, or accessed directly in the 'output' slot of the resulting model (i.e., modelName\$output). Components of the output may be referenced using the Extract functionality.

## Value

Returns a list containing an MxExpectationNormal object and an MxFitFunctionML object.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## Examples

```
# Create and fit a model using mxMatrix, mxAlgebra, mxExpectationNormal, and mxFitFunctionML
library(OpenMx)
# Simulate some data
x=rnorm(1000, mean=0, sd=1)
y= 0.5*x + rnorm(1000, mean=0, sd=1)
tmpFrame <- data.frame(x, y)
tmpNames <- names(tmpFrame)
# Define the matrices
M <- mxMatrix(type = "Full", nrow = 1, ncol = 2, values=c(0,0),
    free=c(TRUE,TRUE), labels=c("Mx", "My"), name = "M")
S <- mxMatrix(type = "Full", nrow = 2, ncol = 2, values=c(1,0,0,1),
    free=c(TRUE,FALSE,FALSE,TRUE), labels=c("Vx", NA, NA, "Vy"), name = "S")
A <- mxMatrix(type = "Full", nrow = 2, ncol = 2, values=c(0,1,0,0),
    free=c(FALSE,TRUE,FALSE,FALSE), labels=c(NA, "b", NA, NA), name = "A")
I <- mxMatrix(type="Iden", nrow=2, ncol=2, name="I")
# Define the expectation
expCov <- mxAlgebra(solve(I-A) %*% S %*% t(solve(I-A)), name="expCov")
expFunction <- mxExpectationNormal(covariance="expCov", means="M", dimnames=tmpNames)
```

```
# Choose a fit function
fitFunction <- mxFitFunctionML()
# Define the model
tmpModel <- mxModel(model="exampleModel", M, S, A, I, expCov, expFunction, fitFunction,
    mxData(observed=tmpFrame, type="raw"))
# Fit the model and print a summary
tmpModelOut <- mxRun(tmpModel)
summary(tmpModelOut)
```

```
MxFitFunction-class MxFitFunction
```

## Description

This is an internal class and should not be used directly.
mxFitFunctionAlgebra Create MxFitFunctionAlgebra Object

## Description

$m x F i t F u n c t i o n A l g e b r a$ returns an MxFitFunctionAlgebra object.

## Usage

```
mxFitFunctionAlgebra(algebra, numObs = NA, numStats = NA, ..., gradient =
NA_character_, hessian = NA_character_, verbose = 0L, units="-2lnL")
```

## Arguments

| algebra | A character string indicating the name of an MxAlgebra or MxMatrix object to <br> use for optimization. <br> (optional) An adjustment to the total number of observations in the model. |
| :--- | :--- |
| numObs | (optional) An adjustment to the total number of observed statistics in the model. |
| numStats | Not used. Forces remaining arguments to be specified by name. |
| $\ldots$ | (optional) A character string indicating the name of an MxAlgebra object. |
| gradient | (optional) A character string indicating the name of an MxAlgebra object. |
| hessian | (optional An integer to increase the level of runtime log output. |
| verbose | (optional) The units of the fit statistic. |

## Details

Fit functions are functions for which free parameter values are chosen such that the value of the objective function is minimized. While the other fit functions in OpenMx require an expectation function for the model, the mxAlgebraObjective function uses the referenced MxAlgebra or MxMatrix object as the function to be minimized.
If a model's fit function is an mxFitFunctionAlgebra objective function, then the referenced algebra in the objective function must return a $1 \times 1$ matrix (when using OpenMx's default optimizer). There is no restriction on the dimensions of an fit function that is not the primary, or 'topmost', objective function.
To evaluate an algebra fit function, place the following objects in a MxModel object: a mxFitFunctionAlgebra, MxAlgebra and MxMatrix entities referenced by the MxAlgebraObjective, and optional MxBounds and MxConstraint objects. This model may then be evaluated using the mxRun function. The results of the optimization may be obtained using the mxEval function on the name of the MxAlgebra, after the model has been run.

First and second derivatives can be provided with the algebra fit function. The dimnames on the gradient and hessian MxAlgebras are matched against names of free variables. Names that do not match are ignored. If you are working in log likelihood units, the customary -2 scaling factor is not applied automatically. You have to take care of multiplying by -2 yourself.

## Value

Returns an MxFitFunctionAlgebra object. MxFitFunctionAlgebra objects should be included with models with referenced MxAlgebra and MxMatrix objects.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## See Also

$m x A l g e b r a$ to create an algebra suitable as a reference function to be minimized. More information about the OpenMx package may be found here.

## Examples

```
# Create and fit a very simple model that adds two numbers using mxFitFunctionAlgebra
library(OpenMx)
# Create a matrix 'A' with no free parameters
A <- mxMatrix('Full', nrow = 1, ncol = 1, values = 1, name = 'A')
# Create an algebra 'B', which defines the expression A + A
B <- mxAlgebra(A + A, name = 'B')
# Define the objective function for algebra 'B'
objective <- mxFitFunctionAlgebra('B')
```

```
# Place the algebra, its associated matrix and
# its objective function in a model
tmpModel <- mxModel(model="Addition", A, B, objective)
# Evalulate the algebra
tmpModelOut <- mxRun(tmpModel)
# View the results
tmpModelOut$output$minimum
```

mxFitFunctionGREML Create MxFitFunctionGREML Object

## Description

This function creates a new MxFitFunctionGREML object.

## Usage

mxFitFunctionGREML(dV=character(0))

## Arguments

$d V$
Vector of character strings; defaults to a character vector of length zero. If a value of non-zero length is provided, it must be a named character vector. This vector's names must be the labels of free parameters in the model. The vector's elements (i.e., the character strings themselves) must be the names of MxAlgebra or MxMatrix object(s), each of which equals the first partial derivatives of the 'V' matrix with respect to the corresponding free parameter.

## Details

Making effective use of argument dV will usually require a custom mxComputeSequence(). The derivatives of the REML loglikelihood function with respect to parameters can be internally computed from the derivatives of the ' $V$ ' matrix supplied via dV . These loglikelihood derivatives will be valid as long as (1) the derivatives of ' $V$ ' evaluate to symmetric matrices the same size as 'V,' and (2) the model contains no MxConstraints.

## Value

Returns a new object of class MxFitFunctionGREML.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## See Also

See MxFitFunctionGREML for the S 4 class created by mxFitFunctionGREML(). For more information generally concerning GREML analyses, including a complete example, see mxExpectationGREML(). More information about the OpenMx package may be found here.

## Examples

```
gff <- mxFitFunctionGREML()
str(gff)
```

```
MxFitFunctionGREML-class
    Class "MxFitFunctionGREML"
```

## Description

MxFitFunctionGREML is the fitfunction class for GREML analyses.

## Objects from the Class

Objects can be created by calls of the form mxFitFunctionGREML(dV).

## Slots

dV : Object of class "MxCharOrNumber". Identifies the MxAlgebra or MxMatrix object(s) to serve as the derivatives of ' $V$ ' with respect to free parameters.
dV names: Vector of character strings; names of the free parameters corresponding to slot dV .
info: Object of class "list".
dependencies: Object of class "integer".
expectation: Object of class "integer".
vector: Object of class "logical".
result: Object of class "matrix".
name: Object of class "character".
numObs: Object of class "integer".

## Extends

Class "MxBaseFitFunction", directly. Class "MxBaseNamed", by class "MxBaseFitFunction", distance 2. Class "MxFitFunction", by class "MxBaseFitFunction", distance 2.

## Methods

No methods defined with class "MxFitFunctionGREML" in the signature.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia. edu/documentation.

## See Also

See mxFitFunctionGREML () for creating MxFitFunctionGREML objects. See mxExpectationGREML() for creating MxExpectationGREML objects, and for more information generally concerning GREML analyses, including a complete example. More information about the OpenMx package may be found here.

## Examples

showClass("MxFitFunctionGREML")

```
mxFitFunctionML Create MxFitFunctionML Object
```

## Description

This function creates a new MxFitFunctionML object.

## Usage

mxFitFunctionML(vector = FALSE, rowDiagnostics = FALSE)

## Arguments

vector A logical value indicating whether the objective function result is the likelihood vector.
rowDiagnostics A logical value indicating whether the row-wise results of the objective function should be returned as an attribute of the fit function.

## Details

Fit functions are functions for which free parameter values are optimized such that the value of a cost function is minimized. The mxFitFunctionML function computes $-2 *(\log$ likelihood) of the data given the current values of the free parameters and the expectation function (e.g., mxExpectationNormal or mxExpectationRAM) selected for the model.
The 'vector' argument is either TRUE or FALSE, and determines whether the objective function returns a column vector of the likelihoods, or a single $-2 *$ (log likelihood) value.
The 'rowDiagnostics' arguent is either TRUE or FALSE, and determines whether the row likelihoods are returned as an attribute of the fit function. It is sometimes useful to inspect the likelihoods for outliers, diagnostics, or other anomalies.

When vector=FALSE and rowDiagnostics=TRUE, fitfunction can be referenced in the model and included in algebras as a scalar. The row likelihoods are an attribute of the fit function but are not accessible in the model.

## Usage Notes:

The results of the optimization can be reported using the summary function, or accessed directly in the 'output' slot of the resulting model (i.e., modelName\$output). Components of the output may be referenced using the Extract functionality.

## Value

Returns a new MxFitFunctionML object. One and only one MxFitFunctionML object should be included in each model along with an associated mxExpectationNormal or mxExpectationRAM object.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## Examples

```
# Create and fit a model using mxMatrix, mxAlgebra, mxExpectationNormal, and mxFitFunctionML
library(OpenMx)
# Simulate some data
x=rnorm(1000, mean=0, sd=1)
y= 0.5*x + rnorm(1000, mean=0, sd=1)
tmpFrame <- data.frame(x, y)
tmpNames <- names(tmpFrame)
# Define the matrices
M <- mxMatrix(type = "Full", nrow = 1, ncol = 2, values=c(0,0),
    free=c(TRUE,TRUE), labels=c("Mx", "My"), name = "M")
S <- mxMatrix(type = "Full", nrow = 2, ncol = 2, values=c(1,0,0,1),
    free=c(TRUE,FALSE,FALSE,TRUE), labels=c("Vx", NA, NA, "Vy"), name = "S")
A <- mxMatrix(type = "Full", nrow = 2, ncol = 2, values=c(0,1,0,0),
    free=c(FALSE,TRUE,FALSE,FALSE), labels=c(NA, "b", NA, NA), name = "A")
I <- mxMatrix(type="Iden", nrow=2, ncol=2, name="I")
# Define the expectation
expCov <- mxAlgebra(solve(I-A) %*% S %*% t(solve(I-A)), name="expCov")
expFunction <- mxExpectationNormal(covariance="expCov", means="M", dimnames=tmpNames)
# Choose a fit function
fitFunction <- mxFitFunctionML()
# Define the model
tmpModel <- mxModel(model="exampleModel", M, S, A, I, expCov, expFunction, fitFunction,
    mxData(observed=tmpFrame, type="raw"))
```

```
# Fit the model and print a summary
tmpModelOut <- mxRun(tmpModel)
summary(tmpModelOut)
mxEval(fitfunction, tmpModelOut)
```

mxFitFunctionMultigroup
Aggregate fit statistics from multiple submodels

## Description

$m x F i t F u n c t i o n M u l t i g r o u p ~ c r e a t e s ~ a ~ f i t ~ f u n c t i o n ~ c o n s i s t i n g ~ o f ~ t h e ~ s u m ~ o f ~ t h e ~ f i t ~ s t a t i s t i c s ~ f r o m ~ a ~ l i s t ~$ of submodels provided.
This is conceptually similar to creating an mxAlgebra consisting of the sum of the subModel objectives and also creating an algebra fit function to optimize the model based on this aggregate value.
This call to $m x F i t F u n c t i o n M u l t i g r o u p: ~$
mxFitFunctionMultigroup(c("model1", "model2"))
then, is almost equivalent to the following pair of statements:
mxAlgebra(model1.objective + model2.objective, name="myAlgebra")
mxFitFunctionAlgebra("myAlgebra")
In addition to being more compact and readable, using mxFitFunctionMultigroup has additional side effects which are valuable for multi-group modeling.
Firstly, it aggregates analytic derivative calculations. Secondly, it allows mxRefModels to compute saturated models for raw data, as this function can learn which are the constituent submodels.
Note: You can refer to the algebra generated by mxFitFunctionMultigroup when used in a group "modelName" as:
modelName.fitfunction

## Usage

mxFitFunctionMultigroup(groups, ..., verbose $=0 \mathrm{~L}$ )

## Arguments

groups vector of fit function names (strings)
... Not used. Forces subsequent arguments to be specified by name.
verbose the level of debugging output

## Examples

require("OpenMx")
mxFitFunctionMultigroup(c("model1", "model2")) \# names of sub-models to be jointly optimised

```
mxFitFunctionR Create MxFitFunctionR Object
```

## Description

$m x F i t F u n c t i o n R$ returns an MxFitFunctionR object.

## Usage

mxFitFunctionR(fitfun, ..., units="-2lnL")

## Arguments

fitfun A function that accepts two arguments.
... The initial state information to the objective function.
units (optional) The units of the fit statistic.

## Details

The mxFitFunctionR function evaluates a user-defined R function called the 'fitfun'. mxFitFunctionR is useful in defining new mxFitFunctions, since any calculation that can be performed in R can be treated as an mxFitFunction.

The 'fitfun' argument must be a function that accepts two arguments. The first argument is the $m x$ Model that should be evaluated, and the second argument is some persistent state information that can be stored between one iteration of optimization to the next iteration. It is valid for the function to simply ignore the second argument.
The function must return either a single numeric value, or a list of exactly two elements. If the function returns a list, the first argument must be a single numeric value and the second element will be the new persistent state information to be passed into this function at the next iteration. The single numeric value will be used by the optimizer to perform optimization.

The initial default value for the persistant state information is NA.
Throwing an exception (via stop) from inside fitfun may result in unpredictable behavior. You may want to wrap your code in tryCatch while experimenting.

## Value

Returns an MxFitFunctionR object.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## Examples

```
# Create and fit a model using mxFitFunctionR
    library(OpenMx)
    A <- mxMatrix(nrow = 2, ncol = 2, values = c(1:4), free = TRUE, name = 'A')
    squared <- function(x) { x ^ 2 }
    # Define the objective function in R
    objFunction <- function(model, state) {
        values <- model$A$values
        return(squared(values[1,1] - 4) + squared(values[1,2] - 3) +
            squared(values[2,1] - 2) + squared(values[2,2] - 1))
}
    # Define the expectation function
    fitFunction <- mxFitFunctionR(objFunction)
    # Define the model
    tmpModel <- mxModel(model="exampleModel", A, fitFunction)
    # Fit the model and print a summary
    tmpModelOut <- mxRun(tmpModel)
    summary(tmpModelOut)
```

    mxFitFunctionRow Create an MxFitFunctionRow Object
    
## Description

mxFitFunctionRow returns an MxFitFunctionRow object.

## Usage

mxFitFunctionRow(rowAlgebra, reduceAlgebra, dimnames, rowResults = "rowResults", filteredDataRow = "filteredDataRow", existenceVector = "existenceVector", units="-2lnL")

## Arguments

rowAlgebra A character string indicating the name of the algebra to be evaluated row-wise.
reduceAlgebra A character string indicating the name of the algebra that collapses the row results into a single number which is then optimized.

```
dimnames A character vector of names corresponding to columns be extracted from the
    data set.
rowResults The name of the auto-generated "rowResults" matrix. See details.
filteredDataRow
    The name of the auto-generated "filteredDataRow" matrix. See details.
existenceVector
The name of the auto-generated "existenceVector" matrix. See details.
units (optional) The units of the fit statistic.
```

## Details

Fit functions are functions for which free parameter values are optimized such that the value of a cost function is minimized. The mxFitFunctionRow function evaluates a user-defined MxAlgebra object called the 'rowAlgebra' in a row-wise fashion. It then stores results of the row-wise evaluation in another MxAlgebra object called the 'rowResults'. Finally, the mxFitFunctionRow function collapses the row results into a single number which is then used for optimization. The MxAlgebra object named by the 'reduceAlgebra' collapses the row results into a single number.
The 'filteredDataRow' is populated in a row-by-row fashion with all the non-missing data from the current row. You cannot assume that the length of the filteredDataRow matrix remains constant (unless you have no missing data). The 'existenceVector' is populated in a row-by-row fashion with a value of 1.0 in column $j$ if a non-missing value is present in the data set in column $j$, and a value of 0.0 otherwise. Use the functions omxSelectRows, omxSelectCols, and omxSelectRowsAndCols to shrink other matrices so that their dimensions will be conformable to the size of 'filteredDataRow'.

## Value

Returns a new MxFitFunctionRow object. Only one MxFitFunction object should be included in each model. There is no need for an MxExpectation object when using mxFitFunctionRow.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## Examples

```
# Model that adds two data columns row-wise, then sums that column
# Notice no optimization is performed here.
library(OpenMx)
xdat <- data.frame(a=rnorm(10), b=1:10) # Make data set
amod <- mxModel(model="example1",
    mxData(observed=xdat, type='raw'),
    mxAlgebra(sum(filteredDataRow), name = 'rowAlgebra'),
    mxAlgebra(sum(rowResults), name = 'reduceAlgebra'),
    mxFitFunctionRow(
        rowAlgebra='rowAlgebra',
        reduceAlgebra='reduceAlgebra',
        dimnames=c('a','b'))
```

```
)
amodOut <- mxRun(amod)
mxEval(rowResults, model=amodOut)
mxEval(reduceAlgebra, model=amodOut)
# Model that find the parameter that minimizes the sum of the
# squared difference between the parameter and a data row.
bmod <- mxModel(model="example2",
    mxData(observed=xdat, type='raw'),
    mxMatrix(values=.75, ncol=1, nrow=1, free=TRUE, name='B'),
    mxAlgebra((filteredDataRow - B) ^ 2, name='rowAlgebra'),
    mxAlgebra(sum(rowResults), name='reduceAlgebra'),
    mxFitFunctionRow(
        rowAlgebra='rowAlgebra',
        reduceAlgebra='reduceAlgebra',
        dimnames=c('a'))
)
bmodOut <- mxRun(bmod)
mxEval(B, model=bmodOut)
mxEval(reduceAlgebra, model=bmodOut)
mxEval(rowResults, model=bmodOut)
```

mxFitFunctionWLS Create MxFitFunctionWLS Object

## Description

This function creates a new MxFitFunctionWLS object.

## Usage

mxFitFunctionWLS(weights = "ULS")

## Arguments

weights Ignored. Uses weights from mxData

## Details

Fit functions are functions for which free parameter values are optimized such that the value of a cost function is minimized. The mxFitFunctionWLS function computes the weighted least squares difference between the data and the model-implied expectations for the data based on the free parameters and the expectation function (e.g., mxExpectationNormal or mxExpectationRAM) selected for the model.

The 'weights' argument is ignored. Rather the weights are provided in the mxData object, often generated by the mxDataWLS function.
Usage Notes:

The results of the optimization can be reported using the summary function, or accessed directly in the 'output' slot of the resulting model (i.e., modelName\$output). Components of the output may be referenced using the Extract functionality.

## Value

Returns a new MxFitFunctionWLS object. One and only one MxFitFunctionWLS object should be included in each model along with an associated mxExpectationNormal or mxExpectationRAM object.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## Examples

```
# Create and fit a model using mxMatrix, mxAlgebra, mxExpectationNormal, and mxFitFunctionWLS
library(OpenMx)
# Simulate some data
x=rnorm(1000, mean=0, sd=1)
y= 0.5*x + rnorm(1000, mean=0, sd=1)
tmpFrame <- data.frame(x, y)
tmpNames <- names(tmpFrame)
wdata <- mxDataWLS(tmpFrame)
# Define the matrices
S <- mxMatrix(type = "Full", nrow = 2, ncol = 2, values=c(1,0,0,1),
    free=c(TRUE,FALSE,FALSE,TRUE), labels=c("Vx", NA, NA, "Vy"), name = "S")
A <- mxMatrix(type = "Full", nrow = 2, ncol = 2, values=c(0,1,0,0),
    free=c(FALSE,TRUE,FALSE,FALSE), labels=c(NA, "b", NA, NA), name = "A")
I <- mxMatrix(type="Iden", nrow=2, ncol=2, name="I")
# Define the expectation
expCov <- mxAlgebra(solve(I-A) %*% S %*% t(solve(I-A)), name="expCov")
expFunction <- mxExpectationNormal(covariance="expCov", dimnames=tmpNames)
# Choose a fit function
fitFunction <- mxFitFunctionWLS()
# Define the model
tmpModel <- mxModel(model="exampleModel", S, A, I, expCov, expFunction, fitFunction,
    wdata)
```

\# Fit the model and print a summary
tmpModelOut <- mxRun(tmpModel)
summary (tmpModelOut)

MxFlatModel-class MxFlatModel

## Description

This is an internal class and should not be used.

```
mxGenerateData Generate data based on an MxModel object
```

## Description

This function creates a randomly sampled data set based on the model.

## Usage

mxGenerateData(model, nrows)

## Arguments

model An MxModel object upon which the data are generated.
nrows Numeric. The number of rows of data to generate.

## Details

This function looks inside the MxModel object to extract the model-implied means and covariance. It then generates data with the same mean and covariance. Data can be generated based on Normal (mxExpectationNormal), RAM (mxExpectationRAM), and LISREL (mxExpectationLISREL) models.
Thresholds and ordinal data are implemented by generating continuous data and then using cut and $m x F a c t o r ~ t o ~ b r e a k ~ t h e ~ c o n t i n o u s ~ d a t a ~ a t ~ t h e ~ t h r e s h o l d s ~ i n t o ~ a n ~ o r d e r e d ~ f a c t o r . ~$
For state space models (i.e. models with an mxExpectationStateSpace expectation), the data are generated based on the autoregressive structure of the model. The rows of data in a state space model are not independent replicates of a stationary process. Rather, they are the result of a latent (possibly non-stationary) autoregressive process. For state space models different rows of data often correspond to different times.

## Value

A matrix or data.frame with nrows rows.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## Examples

```
#----------
# Create data based on state space model.
require(OpenMx)
nvar <- 5
varnames <- paste("x", 1:nvar, sep="")
ssModel <- mxModel(model="State Space Manual Example",
    mxMatrix("Full", 1, 1, TRUE, .3, name="A"),
    mxMatrix("Zero", 1, 1, name="B"),
    mxMatrix("Full", nvar, 1, TRUE, .6, name="C", dimnames=list(varnames, "F1")),
    mxMatrix("Zero", nvar, 1, name="D"),
    mxMatrix("Diag", 1, 1, FALSE, 1, name="Q"),
    mxMatrix("Diag", nvar, nvar, TRUE, .2, name="R"),
    mxMatrix("Zero", 1, 1, name="x0"),
    mxMatrix("Diag", 1, 1, FALSE, 1, name="P0"),
    mxMatrix("Zero", 1, 1, name="u"),
    mxExpectationStateSpace("A", "B", "C", "D", "Q", "R", "x0", "P0", "u"),
    mxFitFunctionML()
)
ssData <- mxGenerateData(ssModel, 200) # 200 time points
# Add simulated data to model
ssModel <- mxModel(ssModel, mxData(ssData, 'raw'))
# Fit model to simulated data
ssRun <- mxRun(ssModel)
# Compare parameters estimated from random data to
# their true generating values
cbind(Rand=omxGetParameters(ssRun), Gen=omxGetParameters(ssModel))
# Note the parameters should be "close" (up to sampling error)
# to the generating values
#----------
require(OpenMx)
manifests <- paste("x", 1:5, sep="")
latents <- c("G")
factorModel <- mxModel("One Factor",
    type="RAM",
    manifestVars = manifests,
    latentVars = latents,
    mxPath(from=latents, to=manifests, values=.8),
    mxPath(from=manifests, arrows=2, values=.2),
    mxPath(from=latents, arrows=2,
        free=FALSE, values=1.0),
```

```
    mxPath(from = 'one', to = manifests))
    factorData <- mxGenerateData(factorModel, 100)
    factorModel <- mxModel(factorModel, mxData(factorData, 'raw'))
    factorRun <- mxRun(factorModel)
    cbind(Rand=omxGetParameters(factorRun), Gen=omxGetParameters(factorModel))
```

    \(m x G e t E x p e c t e d \quad\) Extract the component from a model's expectation
    
## Description

This function extracts the expected means, covariance, or thresholds from a model.

## Usage

mxGetExpected(model, component) imxGetExpectationComponent(model, component)

## Arguments

model MxModel object from which to extract the expectation component.
component A character. The name of the component to extract.

## Details

The expected means, covariance, or thresholds can be extracted from Normal (mxExpectationNormal), RAM (mxExpectationRAM), and LISREL (mxExpectationLISREL) models.

## Value

A matrix, giving the expectation component requested.

## References

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

## Examples

```
#----------
require(OpenMx)
manifests <- paste("x", 1:5, sep="")
latents <- c("G")
factorModel <- mxModel("One Factor",
    type="RAM",
```

```
    manifestVars = manifests,
    latentVars = latents,
    mxPath(from=latents, to=manifests),
    mxPath(from=manifests, arrows=2),
    mxPath(from=latents, arrows=2,
    free=FALSE, values=1.0),
mxPath(from = 'one', to = manifests))
mxGetExpected(factorModel, "covariance")
# oops. Starting values indicate a zero covariance matrix.
# Probably should adjust them.
```

mxGREMLDataHandler Helper Function for Structuring GREML Data

## Description

This function takes a dataframe or matrix and uses it to setup the ' $y$ ' and ' $X$ ' matrices for a GREML analysis; this includes trimming out NAs from ' X ' and ' y .' The result is a matrix the first column of which is the ' $y$ ' vector, and the remaining columns of which constitute ' X .'

## Usage

mxGREMLDataHandler(data, yvars=character(0), Xvars=list(), addOnes=TRUE, blockByPheno=TRUE, staggerZeroes=TRUE)

## Arguments

data Either a dataframe or matrix, with column names, containing the variables to be used as phenotypes and covariates in ' y ' and ' X ,' respectively.
yvars Character vector. Each string names a column of the raw dataset, to be used as a phenotype.
Xvars A list of data column names, specifying the covariates to be used with each phenotype. The list should have the same length as argument yvars.
addOnes Logical; should lead columns of ones (for the regression intercepts) be adhered to the covariates when assembling the ' X ' matrix? Defaults to TRUE.
blockByPheno Logical; relevant to polyphenotype analyses. If TRUE (default), then the resulting 'y' will contain phenotype \#1 for individuals 1 thru $n$, phenotype \#2 for individuals 1 thru $n, \ldots$ If FALSE, then observations are "blocked by individual", and the resulting 'y' will contain individual \#1's scores on phenotypes 1 thru $p$, individual \#2's scores on phenotypes 1 thru $p, \ldots$ Note that in either case, ' X ' will be structured appropriately for 'y.'
staggerZeroes Logical; relevant to polyphenotype analyses. If TRUE (default), then each phenotype's covariates in ' X ' are "staggered," and ' X ' is padded out with zeroes. If FALSE, then ' X ' is formed simply by stacking the phenotypes' covariates;
this requires each phenotype to have the same number of covariates (i.e., each character vector in Xvars must be of the same length). The default (TRUE) is intended for instances where the multiple phenotypes truly are different variables, whereas staggerZeroes=FALSE is intended for instances where the multiple "phenotypes" actually represent multiple observations on the same variable. One example of the latter case is longitudinal data where the multiple "phenotypes" are repeated measures on a single phenotype.

## Details

For a monophenotype analysis (only), argument Xdata can be a character vector. In a polyphenotype analysis, if the same covariates are to be used with all phenotypes, then Xdata can be a list of length 1.
Note the synergy between the output of mxGREMLDataHandler() and arguments dataset.is. yX and casesToDropFromV to mxExpectationGREML ().

If the dataframe or matrix supplied for argument data has $n$ rows, and argument yvars is of length $p$, then the resulting ' y ' and ' X ' matrices will have $n p$ rows. Then, if either matrix contains any NA's, the rows containing the NA's are trimmed from both ' X ' and ' y ' before being returned in the output (in which case they will obviously have fewer than $n p$ rows). Function mxGREMLDataHandler() reports which rows of the full-size ' X ' and ' y ' were trimmed out due to missing observations. These row indices can be provided as argument casesToDropFromV to mxExpectationGREML ().

## Value

A list with these two components:

$$
\begin{array}{ll}
\text { yX } & \begin{array}{l}
\text { Numeric matrix. The first column is the phenotype vector, 'y,' while the re- } \\
\text { maining columns constitutethe ' } X \text { ' matrix of covariates. If this matrix is used } \\
\text { as the raw dataset for a model, then the model's GREML expectation can be }
\end{array} \\
\text { constructed with dataset. is. } \mathrm{yX}=\text { TRUE in mxExpectationGREML(). } \\
\text { casesToDrop } & \begin{array}{l}
\text { Numeric vector. Contains the indices of the rows of the ' 'y' and ' ' } X \text { ' that were } \\
\text { dropped due to containing NA's. Can be provided as as argument casesToDropFromV } \\
\text { to mxExpectationGREML(). }
\end{array}
\end{array}
$$

## Examples

```
dat <- cbind(rnorm(100),rep(1,100))
colnames(dat) <- c("y","x")
dat[42,1] <- NA
dat[57,2] <- NA
```

```
    dat2 <- mxGREMLDataHandler(data=dat, yvars="y", Xvars=list("x"),
        addOnes = FALSE)
    str(dat2)
```

    MxInterval-class MxInterval
    
## Description

This is an internal class and should not be used directly.

## See Also

mxCI

$$
\text { mxKalmanScores } \quad \text { Estimate Kalman scores and error covariance matrices }
$$

## Description

This function creates the Kalman predicted, Kalman updated, and Rauch-Tung-Striebel smoothed latent state and error covariance estimates for an MxModel object that has an MxExpectationStateSpace object.

## Usage

mxKalmanScores(model, data=NA)

## Arguments

| model | An MxModel object with an MxExpectationStateSpace. |
| :--- | :--- |
| data | An optional data.frame or matrix. |

## Details

This is a helper function that computes the results of the classical Kalman filter. In particular, for every row of data there is a predicted latent score, an error covariance matrix for the predicted latent scores that provides an estimate of the predictions precision, an updated latent score, and an updated error covariance matrix for the updated lated scores. Additionally, the Rauch-Tung-Striebel (RTS) smoothed latent scores and error covariance matrices are returned.

Value
A list with components xPredicted, PPredicted, xUpdated, PUpdated, xSmoothed, PSmoothed, m 211 , and L . The rows of $x$ Predicted, $x$ Updated, and $x$ Smoothed correspond to different time points. The columns are the different latent variables. The third index of PPredicted, PUpdated, and PSmoothed corresponds to different times. This works nicely with the R default print method for arrays. At each time there is a covariance matrix of the latent variable scores. For all items listed below, the first element goes with the zeroth time point (See example).
xPredicted matrix of Kalman predicted scores
PPredicted array of Kalman predicted error covariances
xUpdated matrix of Kalman updated scores
PUpdated array of Kalman updated error covariances
xSmoothed matrix of RTS smoothed scores
PSmoothed array of RTS smoothed error covariances
m2ll minus $2 \log$ likelihood
L likelihood

    MxLISRELModel-class MxLISRELModel
    
## Description

This is an internal class and should not be used directly.

```
mxLISRELObjective

\section*{Description}

This function creates a new MxLISRELObjective object.

\section*{Usage}
\(m x L I S R E L O b j e c t i v e(L X=N A, L Y=N A, B E=N A, G A=N A, P H=N A, P S=N A, T D=N A, T E=N A, T H=N A\), \(T X=N A, T Y=N A, K A=N A, A L=N A\),
dimnames = NA, thresholds = NA, vector = FALSE, threshnames = dimnames)

\section*{Arguments}

LX An optional character string indicating the name of the ' LX ' matrix.
LY An optional character string indicating the name of the 'LY' matrix.
BE An optional character string indicating the name of the 'BE' matrix.
GA An optional character string indicating the name of the 'GA' matrix.
PH An optional character string indicating the name of the ' PH ' matrix.
PS An optional character string indicating the name of the 'PS' matrix.
TD An optional character string indicating the name of the 'TD' matrix.
TE An optional character string indicating the name of the ' TE ' matrix.
TH An optional character string indicating the name of the 'TH' matrix.
TX An optional character string indicating the name of the 'TX' matrix.
TY An optional character string indicating the name of the 'TY' matrix.
KA An optional character string indicating the name of the 'KA' matrix.
AL An optional character string indicating the name of the 'AL' matrix.
dimnames An optional character vector that is currently ignored
thresholds An optional character string indicating the name of the thresholds matrix.
vector A logical value indicating whether the objective function result is the likelihood vector.
threshnames An optional character vector to be assigned to the column names of the thresholds matrix.

\section*{Details}

Objective functions are functions for which free parameter values are chosen such that the value of the objective function is minimized. The mxLISRELObjective provides maximum likelihood estimates of free parameters in a model of the covariance of a given MxData object. This model is defined by LInear Structual RELations (LISREL; Jöreskog \& Sörbom, 1982, 1996). Arguments 'LX' through 'AL' must refer to MxMatrix objects with the associated properties of their respective matrices in the LISREL modeling approach.
The full LISREL specification has 13 matrices and is sometimes called the extended LISREL model. It is defined by the following equations.
\[
\begin{gathered}
\eta=\alpha+B \eta+\Gamma \xi+\zeta \\
y=\tau_{y}+\Lambda_{y} \eta+\epsilon \\
x=\tau_{x}+\Lambda_{x} \xi+\delta
\end{gathered}
\]

The table below is provided as a quick reference to the numerous matrices in LISREL models. Note that NX is the number of manifest exogenous (independent) variables, the number of Xs. NY is the number of manifest endogenous (dependent) variables, the number of Ys. NK is the number of latent exogenous variables, the number of Ksis or Xis. NE is the number of latent endogenous variables, the number of etas.
\begin{tabular}{clccll} 
Matrix & Word & Abbreviation & Dimensions & Expression & Description \\
\(\Lambda_{x}\) & Lambda x & LX & NX x NK & & Exogenous Factor Loading Matrix \\
\(\Lambda_{y}\) & Lambda y & LY & NY x NE & & Endogenous Factor Loading Matrix \\
\(B\) & Beta & BE & NE x NE & & Regressions of Latent Endogenous Variables Pre \\
\(\Gamma\) & Gamma & GA & NE x NK & & Regressions of Latent Exogenous Variables Pred \\
\(\Phi\) & Phi & PH & NK x NK & \(\operatorname{cov}(\xi)\) & Covariance Matrix of Latent Exogenous Variable \\
\(\Psi\) & Psi & PS & NE x NE & \(\operatorname{cov}(\zeta)\) & Residual Covariance Matrix of Latent Endogeno \\
\(\Theta_{\delta}\) & Theta delta & TD & NX x NX & \(\operatorname{cov}(\delta)\) & Residual Covariance Matrix of Manifest Exogen \\
\(\Theta_{\epsilon}\) & Theta epsilon & TE & NY x NY & \(\operatorname{cov}(\epsilon)\) & Residual Covariance Matrix of Manifest Endoge \\
\(\Theta_{\delta \epsilon}\) & Theta delta epsilson & TH & NX x NY & \(\operatorname{cov}(\delta, \epsilon)\) & Residual Covariance Matrix of Manifest Exogen \\
\(\tau_{x}\) & tau x & TX & NX x 1 & & Residual Means of Manifest Exogenous Variable \\
\(\tau_{y}\) & tau y & TY & NY x & & Residual Means of Manifest Endogenous Variabl \\
\(\kappa\) & kappa & KA & NK x 1 & \(\operatorname{mean}(\xi)\) & Means of Latent Exogenous Variables \\
\(\alpha\) & alpha & AL & NE x 1 & & Residual Means of Latent Endogenous Variables
\end{tabular}

From the extended LISREL model, several submodels can be defined. Subtypes of the LISREL model are defined by setting some of the arguments of the LISREL objective to NA. Note that because the default values of each LISREL matrix is NA, setting a matrix to NA can be accomplished by simply not giving it any other value.
The first submodel is the LISREL model without means.
\[
\begin{gathered}
\eta=B \eta+\Gamma \xi+\zeta \\
y=\Lambda_{y} \eta+\epsilon \\
x=\Lambda_{x} \xi+\delta
\end{gathered}
\]

The LISREL model without means requires 9 matrices: LX, LY, BE, GA, PH, PS, TD, TE, and TH. Hence this LISREL model has TX, TY, KA, and AL as NA. This can be accomplished be leaving these matrices at their default values.
The TX, TY, KA, and AL matrices must be specified if either the mxData type is "cov" or "cor" and a means vector is provided, or if the mxData type is "raw". Otherwise the TX, TY, KA, and AL matrices are ignored and the model without means is estimated.

A second submodel involves only endogenous variables.
\[
\begin{gathered}
\eta=B \eta+\zeta \\
y=\Lambda_{y} \eta+\epsilon
\end{gathered}
\]

The endogenous-only LISREL model requires 4 matrices: LY, BE, PS, and TE. The LX, GA, PH, TD, and TH must be NA in this case. However, means can also be specified, allowing TY and AL if the data are raw or if observed means are provided.

Another submodel involves only exogenous variables.
\[
x=\Lambda_{x} \xi+\delta
\]

The exogenous-model model requires 3 matrices: LX, PH, and TD. The LY, BE, GA, PS, TE, and TH matrices must be NA. However, means can also be specified, allowing TX and KA if the data are raw or if observed means are provided.
The model that is run depends on the matrices that are not NA. If all 9 matrices are not NA, then the full model is run. If only the 4 endogenous matrices are not NA, then the endogenous-only model is run. If only the 3 exogenous matrices are not NA, then the exogenous-only model is run. If some endogenous and exogenous matrices are not NA, but not all of them, then appropriate errors are thrown. Means are included in the model whenever their matrices are provided.

The MxMatrix objects included as arguments may be of any type, but should have the properties described above. The mxLISRELObjective will not return an error for incorrect specification, but incorrect specification will likely lead to estimation problems or errors in the mxRun function.
Like the mxRAMObjective, the mxLISRELObjective evaluates with respect to an MxData object. The MxData object need not be referenced in the mxLISRELObjective function, but must be included in the MxModel object. mxLISRELObjective requires that the 'type' argument in the associated MxData object be equal to 'cov', 'cor', or 'raw'.
To evaluate, place MxLISRELObjective objects, the mxData object for which the expected covariance approximates, referenced MxAlgebra and MxMatrix objects, and optional MxBounds and MxConstraint objects in an MxModel object. This model may then be evaluated using the mxRun function. The results of the optimization can be found in the 'output' slot of the resulting model, and may be obtained using the mxEval function.

\section*{Value}

Returns a new MxLISRELObjective object. MxLISRELObjective objects should be included with models with referenced MxAlgebra, MxData and MxMatrix objects.

##### Factor Model

mLX <- mxMatrix("Full", values=c(.5, . 6, . 8, rep(0, 6), .4, .7, . 5),
name="LX", nrow=6, ncol=2,
free=c(TRUE,TRUE,TRUE,rep(FALSE, 6),TRUE,TRUE,TRUE))
mTD <- mxMatrix("Diag", values=c(rep(.2, 6)), name="TD", nrow=6, ncol=6,

```
free=TRUE)
mPH <- mxMatrix("Symm", values=c(1, .3, 1), name="PH", nrow=2, ncol=2,
free=c(FALSE, TRUE, FALSE))
\# Create a LISREL objective with LX, TD, and PH matrix names
objective <- mxLISRELObjective(LX="LX", TD="TD", PH="PH")
testModel <- mxModel(model="testModel", mLX, mTD, mPH, objective)

MxListOrNull-class An optional list

\section*{Description}

An optional list
```

mxMakeNames mxMakeNames

```

\section*{Description}

Adjust a character vector so that it can be used as MxMatrix column or row names. OpenMx is (much) more restrictive than base R's make.names.

\section*{Usage}
mxMakeNames(names, unique = FALSE)

\section*{Arguments}
names a character vector
unique whether the pass the result through make.unique

\section*{See Also}
make.names

\section*{Examples}
```

demo <- c("", "103", "data", "foo.bar[3,2]", "+!", "!+")
mxMakeNames(demo, unique=TRUE)

```

\section*{Description}

This function creates a new MxMatrix object.
```

Usage
mxMatrix(type = "Full", nrow = NA, ncol = NA, free = FALSE, values = NA, labels = NA, lbound = NA, ubound = NA, byrow = getOption('mxByrow'), dimnames = NA, name = NA, condenseSlots=getOption('mxCondenseMatrixSlots'))

```

\section*{Arguments}
type A character string indicating the matrix type, where type indicates the range of values and equalities in the matrix. Must be one of: 'Diag', 'Full', 'Iden', 'Lower', 'Sdiag', 'Stand', 'Symm', 'Unit', or 'Zero'.
nrow Integer; the desired number of rows. One or both of 'nrow' and 'ncol' is required when 'values', 'free', 'labels', 'lbound', and 'ubound' arguments are not matrices, depending on the desired MxMatrix type.
ncol Integer; the desired number of columns. One or both of 'nrow' and 'ncol' is required when 'values', 'free', 'labels', 'lbound', and 'ubound' arguments are not matrices, depending on the desired MxMatrix type.
free A vector or matrix of logicals for free parameter specification. A single 'TRUE' or 'FALSE' will set all allowable variables to free or fixed, respectively.
values A vector or matrix of numeric starting values. By default, all values are set to zero.
labels A vector or matrix of characters for variable label specification.
lbound A vector or matrix of numeric lower bounds. Default bounds are specified with an NA.
ubound A vector or matrix of numeric upper bounds. Default bounds are specified with an NA.
byrow Logical; defaults to value of global option 'mxByRow'. If FALSE (default), the 'values', 'free', 'labels', 'lbound', and 'ubound' matrices are populated by column rather than by row.
dimnames List. The dimnames attribute for the matrix: a list of length 2 giving the row and column names respectively. An empty list is treated as NULL, and a list of length one as row names. The list can be named, and the list names will be used as names for the dimensions.
name An optional character string indicating the name of the MxMatrix object.

\begin{abstract}
condenseSlots Logical; defaults to value of global option 'mxByRow' If TRUE, then the resulting MxMatrix will "condense" its 'labels', ‘free', 'lbound', and ‘ubound' down to \(1 x 1\) matrices if they contain only FALSE ('free') or NA (the other three). If FALSE, those four matrices and the 'values' matrix will all be of equal dimensions.
\end{abstract}

\section*{Details}

The mxMatrix function creates MxMatrix objects, which consist of five matrices and a 'type' argument. The 'values' matrix is made up of numeric elements whose usage and capabilities in other functions are defined by the 'free' matrix. If an element is specified as a fixed parameter in the 'free' matrix, then the element in the 'values' matrix is treated as a constant value and cannot be altered or updated by an objective function when included in an mxRun function. If an element is specified as a free parameter in the 'free' matrix, the element in the 'value' matrix is considered a starting value and can be changed by an objective function when included in an mxRun function.
Objects created by the mxMatrix() function are of a specific 'type', which specifies the number and location of parameters in the 'labels' matrix and the starting values in the 'values' matrix. Input 'values', 'free', and 'labels' matrices must be of appropriate shape and have appropriate values for the matrix type requested. Nine types of matrices are supported:
'Diag' matrices must be square, and only elements on the principal diagonal may be specified as free parameters or take n matrices may be either rectangular or square, and all elements in the matrix may be freely estimated. This type is th matrices must be square, and consist of no free parameters. Matrices of this type have a value of 1 for all entries on matrices must be square, with a value of 0 for all entries in the upper triangle and no free parameters in the upper \(\operatorname{tr}\) matrices must be square, with a value of 0 for all entries in the upper triangle and along the diagonal. No free paran matrices must be square, and elements in the principle diagonal and lower triangular portion of the matrix may be \(f\) matrices are symmetric matrices (see 'Symm') with 1's along the main diagonal.
'Unit' matrices may be either rectangular or square, and contain no free parameters. All elements in matrices of this type
'Zero' matrices may be either rectangular or square, and contain no free parameters. All elements in matrices of this type
't' 'ubound' may be vectors of length \(N *(N+1) / 2\), where N is the number of rows and columns of the matrix. When 'type' is 'Sdiag' or 'Stand', then the arguments to 'free', 'values', 'labels', 'lbound', or ‘ubound' may be vectors of length \(N *(N-1) / 2\).

\section*{Value}

Returns a new MxMatrix object, which consists of a 'values' matrix of numeric starting values, a 'free' matrix describing free parameter specification, a 'labels' matrix of labels for the variable names, and 'lbound' and 'ubound' matrices of the lower and upper parameter bounds. This MxMatrix object can be used as an argument in the mxAlgebra(), mxBounds(), mxConstraint () and mxModel() functions.

        ncol = 3, name = "I")
    # Create a full 4 x 2 matrix from existing
    # value matrix with all free parameters
    vals <- matrix(1:8, nrow = 4)
    fullMatrix <- mxMatrix(type = "Full", values = vals,
        free = TRUE, name = "foo")
    # Create a 3 x 3 symmetric matrix with free off-
    # diagonal parameters and starting values
    symmMatrix <- mxMatrix(type = "Symm", nrow = 3, ncol = 3,
        free = c(FALSE, TRUE, TRUE, FALSE, TRUE, FALSE),
        values = c(1, . 8, . 8, 1, . 8, 1),
        labels = c(NA, "free1", "free2", NA, "free3", NA),
        name = "bar")
    ```
MxMatrix-class MxMatrix Class

\section*{Description}

MxMatrix is a virtual S4 class that comprises the nine types of matrix objects used by OpenMx (see mxMatrix() for details). An MxMatrix object is a named entity. New instances of this class can be created using the function mxMatrix(). MxMatrix objects may be used as arguments in other functions from the OpenMx package, including mxAlgebra(), mxConstraint(), and mxModel().

\section*{Objects from the Class}

All nine types of object that the class comprises can be created via mxMatrix().

\section*{Slots}
name: Character string; the name of the MxMatrix object. Note that this is the object's "Mx name" (so to speak), which identifies it in OpenMx's internal namespace, rather than the symbol identifying it in R's worskpace. Use of MxMatrix objects in an mxAlgebra or mxConstraint function requires reference by name.
values: Numeric matrix of values. If an element is specified as a fixed parameter in the 'free' matrix, then the element in the 'values' matrix is treated as a constant value and cannot be altered or updated by an objective function when included in an mxRun() function. If an element is specified as a free parameter in the 'free' matrix, the element in the 'value' matrix is considered a starting value and can be changed by an objective function when included in an mxRun() function.
labels: Matrix of character strings which provides the labels of free and fixed parameters. Fixed parameters with identical labels must have identical values. Free parameters with identical labels impose an equality constraint. The same label cannot be applied to a free parameter and a fixed parameter. A free parameter with the label 'NA' implies a unique free parameter, that cannot be constrained to equal any other free parameter.
free: Logical matrix specifying whether each element is free versus fixed. An element is a free parameter if-and-only-if the corresponding value in the 'free' matrix is 'TRUE'. Free parameters are elements of an MxMatrix object whose values may be changed by a fitfunction when that MxMatrix object is included in an MxModel object and evaluated using the mxRun() function.
lbound: Numeric matrix of lower bounds on free parameters.
ubound: Numeric matrix of upper bounds on free parameters.
.squareBrackets: Logical matrix; used internally by OpenMx. Identifies which elements have labels with square brackets in them.
. persist: Logical; used internally by OpenMx. Governs how mxRun() handles the MxMatrix object when it is inside the MxModel being run.
. condenseSlots: Logical; used internally by OpenMx. If FALSE, then the matrices in the 'values', 'labels', 'free', 'lbound', and 'ubound' slots are all of equal dimensions. If TRUE, then the last four of those slots will "condense" a matrix consisting entirely of FALSE or NA down to 1x1.
display: Character string; used internally by OpenMx when parsing MxAlgebras.
dependencies: Integer; used internally by OpenMx when parsing MxAlgebras.

\section*{mxMI Estimate Modification Indices for MxModel Objects}

\section*{Description}

This function estimates the change in fit function value resulting from freeing currently fixed parameters.

\section*{Usage}
mxMI(model, matrices=NA, full=TRUE)

\section*{Arguments}
model
matrices Character vector. The names of the matrices in which to search for modification
full Logical. Whether or not to return the full modification index in addition to the restricted.

\section*{Details}

Modification indices provide an estimate of how much the fit function value would change if a parameter that is currently fixed was instead freely estimated. There are two versions of this estimate: a restricted version and an full version. The restricted version is reported as the MI and is much faster to compute. The full version is reported as MI.Full. The full version accounts for the total change in fit function value resulting from the newly freed parameter. The restricted version only accounts for the change in the fit function due to the movement of the new free parameter. In particular, the restricted version does not account for the change in fit function value due to the other free parameters moving in response to the new parameter.

The algorithm respects fixed parameter labels. That is, when a fixed parameter has a label and occurs in more than one spot, then that fixed parameter is freed in all locations in which it occurs to evaluate the modification index for that fixed parameter.

When the fit function is in minus two log likelihood units (e.g. mxFitFunctionML), then the MI will be approximately chi squared distributed with 1 degree of freedom. Using a p-value of 0.01 has been suggested. Hence, a MI greater than qchisq \((p=1-0.01, d f=1)\), or 6.63 , is suggestive of a modification.
Users should be cautious in their use of modification indices. If a model was created with the aid of MIs, then it should always be reported. Do not pretend that you have a theoretical reason for part of a model that was put there because it was suggested by a modification index. This is fraud. When using modification indices there are two options for best practices. First, you can report the analyses as exploratory. Document all the explorations that you did, and know that your results may or may not generalize. Second, you can use cross-validation. Reserve part of your data for exploration, and use the remaining data to test if the exploratory model generalizes to new data.

\section*{Value}

A named list with components
MI The restricted modification index.
MI.Full The full modification index.
plusOneParamModels A list of models with one additional free parameter

\section*{mxMLObjective DEPRECATED: Create MxMLObjective Object}

\section*{Description}

WARNING: Objective functions have been deprecated as of OpenMx 2.0.
Please use mxExpectationNormal() and mxFitFunctionML() instead. As a temporary workaround, mxMLObjective returns a list containing an MxExpectationNormal object and an MxFitFunctionML object.
\(m x M L O b j e c t i v e(\) covariance, means \(=\) NA, dimnames \(=\) NA, thresholds \(=\) NA) All occurrences of
\(m x M L O b j e c t i v e(\) covariance, means \(=\) NA, dimnames \(=\) NA, thresholds \(=\) NA \()\)
Should be changed to
mxExpectationNormal(covariance, means \(=\) NA, dimnames \(=\) NA, thresholds \(=\) NA, threshnames \(=\) dimnames) \(m x\) FitFunctionML (vector \(=\) FALSE \()\)

\section*{Arguments}
covariance A character string indicating the name of the expected covariance algebra.
means An optional character string indicating the name of the expected means algebra.
dimnames An optional character vector to be assigned to the dimnames of the covariance and means algebras.
thresholds An optional character string indicating the name of the thresholds matrix.

\section*{Details}

NOTE: THIS DESCRIPTION IS DEPRECATED. Please change to using mxExpectationNormal and mxFitFunctionML as shown in the example below.

Objective functions are functions for which free parameter values are chosen such that the value of the objective function is minimized. The mxMLObjective function uses full-information maximum likelihood to provide maximum likelihood estimates of free parameters in the algebra defined by the 'covariance' argument given the covariance of an MxData object. The 'covariance' argument takes an MxAlgebra object, which defines the expected covariance of an associated MxData object. The 'dimnames' arguments takes an optional character vector. If this argument is not a single NA, then this vector be assigned to be the dimnames of the means vector, and the row and columns dimnames of the covariance matrix.
mxMLObjective evaluates with respect to an MxData object. The MxData object need not be referenced in the mxMLObjective function, but must be included in the MxModel object. mxMLObjective requires that the 'type' argument in the associated MxData object be equal to 'cov' or
'cov'. The 'covariance' argument of this function evaluates with respect to the 'matrix' argument of the associated MxData object, while the 'means' argument of this function evaluates with respect to the 'vector' argument of the associated MxData object. The 'means' and 'vector' arguments are optional in both functions. If the 'means' argument is not specified (NA), the optional 'vector' argument of the MxData object is ignored. If the 'means' argument is specified, the associated MxData object should specify a 'means' argument of equivalent dimension as the 'means' algebra.
dimnames must be supplied where the matrices referenced by the covariance and means algebras are not themselves labeled. Failure to do so leads to an error noting that the covariance or means matrix associated with the ML objective does not contain dimnames.
To evaluate, place MxMLObjective objects, the mxData object for which the expected covariance approximates, referenced MxAlgebra and MxMatrix objects, and optional MxBounds and MxConstraint objects in an MxModel object. This model may then be evaluated using the mxRun function. The results of the optimization can be found in the 'output' slot of the resulting model, or using the mxEval function.

\section*{Value}

Returns a list containing an MxExpectationNormal object and an MxFitFunctionML object.

\section*{References}

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

\section*{Examples}
```

# Create and fit a model using mxMatrix, mxAlgebra, mxExpectationNormal, and mxFitFunctionML

library(OpenMx)

# Simulate some data

x=rnorm(1000, mean=0, sd=1)
y= 0.5*x + rnorm(1000, mean=0, sd=1)
tmpFrame <- data.frame(x, y)
tmpNames <- names(tmpFrame)

# Define the matrices

S <- mxMatrix(type = "Full", nrow = 2, ncol = 2, values=c(1,0,0,1),
free=c(TRUE,FALSE,FALSE,TRUE), labels=c("Vx", NA, NA, "Vy"), name = "S")
A <- mxMatrix(type = "Full", nrow = 2, ncol = 2, values=c(0,1,0,0),
free=c(FALSE,TRUE,FALSE,FALSE), labels=c(NA, "b", NA, NA), name = "A")
I <- mxMatrix(type="Iden", nrow=2, ncol=2, name="I")

# Define the expectation

expCov <- mxAlgebra(solve(I-A) %*% S %*% t(solve(I-A)), name="expCov")
expFunction <- mxExpectationNormal(covariance="expCov", dimnames=tmpNames)

# Choose a fit function

```
```

fitFunction <- mxFitFunctionML()

# Define the model

tmpModel <- mxModel(model="exampleModel", S, A, I, expCov, expFunction, fitFunction,
mxData(observed=cov(tmpFrame), type="cov", numObs=dim(tmpFrame)[1]))

# Fit the model and print a summary

tmpModelOut <- mxRun(tmpModel)
summary(tmpModelOut)

```
mxModel Create MxModel Object

\section*{Description}

This function creates a new MxModel object.

\section*{Usage}
mxModel(model = NA, ..., manifestVars = NA, latentVars = NA, remove \(=\) FALSE, independent \(=\) NA, type \(=\) NA, name \(=N A\) )

\section*{Arguments}
model This argument is either an MxModel object or a string. If 'model' is an MxModel object, then all elements of that model are placed in the resulting MxModel object. If 'model' is a string, then a new model is created with the string as its name. If 'model' is either unspecified or 'model' is a named entity, data source, or MxPath object, then a new model is created.
... An arbitrary number of mxMatrix, mxPath, mxData, and other functions such
 as specified in the 'model' argument, based on the 'remove' argument.
manifestVars For RAM-type models, A list of manifest variables to be included in the model.
latentVars For RAM-type models, A list of latent variables to be included in the model.
remove logical. If TRUE, elements listed in this statement are removed from the original model. If FALSE, elements listed in this statement are added to the original model.
independent logical. If TRUE then the model is evaluated independently of other models.
type character vector. The model type to assign to this model. Defaults to options("mxDefaultType"). See below for valid types
name An optional character vector indicating the name of the object.

\section*{Details}

The mxModel function is used to create MxModel objects. Objects created by this function may be new, or may be modified versions of existing MxModel objects. By default a new MxModel object will be created: To create a modified version of an existing MxModel object, include this model in the 'model' argument.
Other named-entities may be added as arguments to the mxModel function, which are then added to or removed from the model specified in the 'model' argument. Other functions you can use to add objects to the model to this way are mxCI, mxAlgebra, mxBounds, mxConstraint, mxData, and mxMatrix objects, as well as objective functions. You can also include MxModel objects as sub-models of the output model, and may be estimated separately or jointly depending on shared parameters and the 'independent' flag discussed below. Only one MxData object and one objective function may be included per model, but there are no restrictions on the number of other namedentities included in an mxModel statement.
All other arguments must be named (i.e. 'latentVars = names'), or they will be interpreted as elements of the ellipsis list. The 'manifestVars' and 'latentVars' arguments specify the names of the manifest and latent variables, respectively, for use with the mxPath function. The 'remove' argument may be used when mxModel is used to create a modified version of an existing MxMatrix object. When 'remove' is set to TRUE, the listed objects are removed from the model specified in the 'model' argument. When 'remove' is set to FALSE, the listed objects are added to the model specified in the 'model' argument.
Model independence may be specified with the 'independent' argument. If a model is independent ('independent \(=\) TRUE'), then the parameters of this model are not shared with any other model. An independent model may be estimated with no dependency on any other model. If a model is not independent ('independent \(=\) FALSE'), then this model shares parameters with one or more other models such that these models must be jointly estimated. These dependent models must be entered as arguments in another model, so that they are simultaneously optimized.

The model type is determined by a character vector supplied to the 'type' argument. The type of a model is a dynamic property, ie. it is allowed to change during the lifetime of the model. To see a list of available types, use the mxTypes command. When a new model is created and no type is specified, the type specified by options("mxDefaultType") is used.

To be estimated, MxModel objects must include objective functions as arguments (mxAlgebraObjective, mxFIMLObjective, mxMLObjective or mxRAMObjective) and executed using the mxRun function. When MxData objects are included in models, the 'type' argument of these objects may require or exclude certain objective functions, or set an objective function as default.

Named entities in MxModel objects may be viewed and referenced by name using the \(\$\) symbol. For instance, for an MxModel named "yourModel" containing an MxMatrix named "yourMatrix", the contents of "yourMatrix" can be accessed as yourModel\$yourMatrix. Slots (i.e., matrices, algebras, etc.) in an mxMatrix may also be referenced with the \(\$\) symbol (e.g., yourModel\$matrices or yourModel\$algebras). See the documentation for Classes and the examples in Classes for more information.

\section*{Value}

Returns a new MxModel object. MxModel objects must include an objective function to be used as arguments in mxRun functions.

\section*{Examples}
```

library(OpenMx)

# At the simplest, you can create an empty model,

# placing it in an object, and add to it later

emptyModel <- mxModel(model="IAmEmpty")

# Create a model named 'firstdraft' with one matrix 'A'

firstModel <- mxModel(model='firstdraft',
mxMatrix(type='Full', nrow = 3, ncol = 3, name = "A"))

# Update 'firstdraft', and rename the model 'finaldraft'

finalModel <- mxModel(model=firstModel,
mxMatrix(type='Symm', nrow = 3, ncol = 3, name = "S"),
mxMatrix(type='Iden', nrow = 3, name = "F"),
name= "finaldraft")

# Add data to the model from an existing data frame in object 'data'

data(twinData) \# load some data
finalModel <- mxModel(model=finalModel, mxData(twinData, type='raw'))

# Two ways to view the matrix named "A" in MxModel object 'model'

finalModel$A
finalModel$matrices\$A

# A working example using OpenMx Path Syntax

data(HS.ability.data) \# load the data

# The manifest variables loading on each proposed latent variable

Spatial <- c("visual", "cubes", "paper")
Verbal <- c("general", "paragrap", "sentence")
Math <- c("numeric", "series", "arithmet")
latents <- c("vis", "math", "text")
manifests <- c(Spatial, Math, Verbal)
HSModel <- mxModel(model="Holzinger_and_Swineford_1939", type="RAM",

```
```

    manifestVars = manifests, # list the measured variables (boxes)
    latentVars = latents, # list the latent variables (circles)
    # factor loadings from latents to manifests
    mxPath(from="vis", to=Spatial),# factor loadings
    mxPath(from="math", to=Math), # factor loadings
    mxPath(from="text", to=Verbal), # factor loadings
    # Allow latent variables to covary
    mxPath(from="vis" , to="math", arrows=2, free=TRUE),
    mxPath(from="vis" , to="text", arrows=2, free=TRUE),
    mxPath(from="math", to="text", arrows=2, free=TRUE),
    # Allow latent variables to have variance (first fixed @ 1)
    mxPath(from=latents, arrows=2, free=c(FALSE,TRUE,TRUE), values=1.0),
    # Manifest have residual variance
    mxPath(from=manifests, arrows=2),
    # the data to be analysed
    mxData(cov(HS.ability.data[,manifests]), type = "cov", numObs = 301))
    fitModel <- mxRun(HSModel) \# run the model
summary(fitModel) \# examine the output: Fit statistics and path loadings

```
```

MxModel-class MxModel Class

```

\section*{Description}

MxModel is an S4 class. An MxModel object is a named entity. New instances of this class can be created using the function \(m x\) Model.

\section*{Details}

The MxModel class has the following slots:
\begin{tabular}{rl} 
name & - The name of the object \\
matrices & - A list of MxMatrix objects \\
algebras & - A list of MxAlgebra objects \\
submodels & - A list of MxModel objects \\
constraints & - A list of MxConstraint objects \\
intervals & - A list of confidence intervals requested in MxCI objects \\
bounds & - A list of MxBounds objects \\
latentVars & - A list of latent variables \\
manifestVars & - A list of manifest variables \\
data & - A MxData object \\
objective & - Either NULL or a MxObjective object \\
independent & - TRUE if-and-only-if the model is independent \\
options & - A list of optimizer options \\
output & - A list with optimization results
\end{tabular}

The 'name' slot is the name of the MxModel object.
The 'matrices' slot contains a list of the MxMatrix objects included in the model. These objects are listed by name. Two objects may not share the same name. If a new MxMatrix is added to an MxModel object with the same name as an MxMatrix object in that model, the added version replaces the previous version. There is no imposed limit on the number of MxMatrix objects that may be added here.

The 'algebras' slot contains a list of the MxAlgebra objects included in the model. These objects are listed by name. Two objects may not share the same name. If a new MxAlgebra is added to an MxModel object with the same name as an MxAlgebra object in that model, the added version replaces the previous version. All MxMatrix objects referenced in the included MxAlgebra objects must be included in the 'matrices' slot prior to estimation. There is no imposed limit on the number of MxAlgebra objects that may be added here.
The 'submodels' slot contains references to all of the MxModel objects included as submodels of this MxModel object. Models held as arguments in other models are considered to be submodels. These objects are listed by name. Two objects may not share the same name. If a new submodel is added to an MxModel object with the same name as an existing submodel, the added version replaces the previous version. When a model containing other models is executed using mxRun, all included submodels are executed as well. If the submodels are dependent on one another, they are treated as one larger model for purposes of estimation.
The 'constraints' slot contains a list of the MxConstraint objects included in the model. These objects are listed by name. Two objects may not share the same name. If a new MxConstraint is added to an MxModel object with the same name as an MxConstraint object in that model, the added version replaces the previous version. All MxMatrix objects referenced in the included MxConstraint objects must be included in the 'matrices' slot prior to estimation. There is no imposed limit on the number of MxAlgebra objects that may be added here.

The 'intervals' slot contains a list of the confidence intervals requested by included MxCI objects. These objects are listed by the free parameters, MxMatrices and MxAlgebras referenced in the MxCI objects, not the list of MxCI objects themselves. If a new MxCI object is added to an MxModel object referencing one or more free parameters MxMatrices or MxAlgebras previously listed in the 'intervals' slot, the new confidence interval(s) replace the existing ones. All listed confidence intervals must refer to free parameters MxMatrices or MxAlgebras in the model.
The 'bounds' slot contains a list of the MxBounds objects included in the model. These objects are listed by name. Two objects may not share the same name. If a new MxBounds is added to an MxModel object with the same name as an MxBounds object in that model, the added version replaces the previous version. All MxMatrix objects referenced in the included MxBounds objects must be included in the 'matrices' slot prior to estimation. There is no imposed limit on the number of MxAlgebra objects that may be added here.
The 'latentVars' slot contains a list of latent variable names, which may be referenced by MxPath objects. This slot defaults to 'NA', and is only used when the mxPath function is used.
The 'manifestVars' slot contains a list of latent variable names, which may be referenced by MxPath objects. This slot defaults to 'NA', and is only used when the mxPath function is used.

The 'data' slot contains an MxData object. This slot must be filled prior to execution when an objective function referencing data is used. Only one MxData object may be included per model, but submodels may have their own data in their own 'data' slots. If an MxData object is added to an MxModel which already contains an MxData object, the new object replaces the existing one.

The 'objective' slot contains an objective function. This slot must be filled prior to using the mxRun function for model execution and optimization. MxAlgebra, MxData, and MxMatrix objects required by the included objective function must be included in the appropriate slot of the MxModel prior to using mxRun.
The 'independent' slot contains a logical value indicating whether or not the model is independent. If a model is independent (independent=TRUE), then the parameters of this model are not shared with any other model. An independent model may be estimated with no dependency on any other model. If a model is not independent (independent=FALSE), then this model shares parameters with one or more other models such that these models must be jointly estimated. These dependent models must be entered as submodels of another MxModel objects, so that they are simultaneously optimized.
The 'options' slot contains a list of options for the optimizer. The name of each entry in the list is the option name to be passed to the optimizer. The values in this list are the values of the optimizer options. The standard interface for updating options is through the mxOption function.
The 'output' slot contains a list of output added to the model by the mxRun function. Output includes parameter estimates, optimization information, model fit, and other information as dictated by the objective function. If a model has not been optimized using the mxRun function, the 'output' slot will be 'NULL'.
Named entities in MxModel objects may be viewed and referenced by name using the \$ symbol. For instance, for an MxModel named "yourModel" containing an MxMatrix named "yourMatrix", the contents of "yourMatrix" can be accessed as yourModel\$yourMatrix. Slots (i.e., matrices, algebras, etc.) in an mxMatrix may also be referenced with the \(\$\) symbol (e.g., yourModel\$matrices or yourModel\$algebras). See the documentation for Classes and the examples in mxModel for more information.

\section*{mxOption Set or Clear an Optimizer Option}

\section*{Description}

The function sets, shows, or clears an option that is specific to the optimizer in the back-end.

\section*{Usage}
mxOption(model, key, value, reset = FALSE)

\section*{Arguments}
\begin{tabular}{ll} 
model & An MxModel object or NULL \\
key & The name of the option. \\
value & The value of the option. \\
reset & If TRUE then reset all options to their defaults.
\end{tabular}

\section*{Details}
 optimizer. Valid option keys are listed below.
Use value \(=\) NULL to remove an existing option. Leaving value blank will return the current value of the option specified by 'key'.

To reset all options to their default values, use 'reset \(=\) TRUE'. When reset \(=\) TRUE, 'key' and 'value' are ignored.
If the 'model' argument is set to NULL, the default optimizer option (i.e those applying to all models by default) will be set.

To see the defaults, use getOption('mxOptions').
Before the model is submitted to the back-end, all keys and values are converted into strings using the as.character function.

The maximum number of major iterations (the option "Major iterations") for optimization for NPSOL can be specified either by using a numeric value (such as 50,1000 , etc) or by specifying a user-defined function. The user-defined function should accept two arguments as input, the number of parameters and the number of constraints, and return a numeric value as output.
OpenMx options
\begin{tabular}{rcl} 
Number of Threads & \(i\) & the number of processor cores to use. Use detectCores() to find how many are \\
Calculate Hessian & {\([\mathrm{Yes} \mathrm{\mid} \mathrm{No]}\)} & \begin{tabular}{l} 
calculate the Hessian explicitly after optimization. \\
Standard Errors
\end{tabular} \\
[Yes | No] & return standard error estimates from the explicitly calculate hessian. \\
Default optimizer & {\([\) NPSOL | SLSQP] } & the gradient descent optimizer to use \\
Number of Threads & {\([0|1| 2|. .|10| . .]\).} & number of threads used for optimization. This is how parallelism works. Default \\
Feasibility tolerance & \(r\) & the maximum acceptable absolute violations in linear and nonlinear constraints. \\
Optimality tolerance & \(r\) & the maximum acceptable difference in fit. \\
Gradient algorithm & see list & finite difference method, either 'forward' or 'central'. \\
Gradient iterations & \(1: 4\) & the number of Richardson extrapolation iterations
\end{tabular}

SLSQP is our new, experimental optimizer.
NPSOL-specific options
\begin{tabular}{rll} 
Nolist & & this option suppresses printing of the options \\
Print level & \(i\) & the value of \(i\) controls the amount of printout produced by the major iterations \\
Minor print level & \(i\) & the value of \(i\) controls the amount of printout produced by the minor iterations \\
Print file & \(i\) & for \(i>0\) a full log is sent to the file with logical unit number \(i\). \\
Summary file & \(i\) & for \(i>0\) a brief log will be output to file \(i\).
\end{tabular}
\begin{tabular}{rcl} 
Infinite bound size & \(r\) & if \(r>0\) defines the "infinite" bound bigbnd. \\
Major iterations & \(i\) or a function & the maximum number of major iterations before termination. \\
Verify level & {\([-1: 3 \mid\) Yes \(\mid\) No \(]\)} & see NPSOL manual. \\
Line search tolerance & \(r\) & controls the accuracy with which a step is taken. \\
Derivative level & {\([0-3]\)} & see NPSOL manual. \\
Hessian & {\([\) Yes | No \(]\)} & return the Hessian (Yes) or the transformed Hessian (No).
\end{tabular}

\section*{Checkpointing options}

Always Checkpoint Checkpoint Directory

Checkpoint Prefix Checkpoint Fullpath

Checkpoint Unit
Checkpoint Count
[Yes I No] whether to checkpoint all models during optimization.
path the directory into which checkpoint files are written.
string the string prefix to add to all checkpoint filenames.
path overrides the directory and prefix (useful to output to \(/ \mathrm{dev} / \mathrm{fd} / 2\) )
see list the type of units for checkpointing: 'minutes', 'iterations', or 'evaluations'.
\(i \quad\) the number of units between checkpoint intervals.

Model transformation options
\begin{tabular}{rcl}
\begin{tabular}{r} 
Error Checking \\
No Sort Data
\end{tabular} & {\([\) Yes \(\mid N o]\)} & \begin{tabular}{l} 
whether model consistency checks are performed in the OpenMx front-end \\
character vector of model names for which FIML data sorting is not performed
\end{tabular} \\
RAM Inverse Optimization & {\([\) Yes \(\mid\) No \(]\)} & \begin{tabular}{l} 
whether to enable solve(I - A) optimization
\end{tabular} \\
RAM Max Depth & \(i\) & the maximum depth to be used when solve \((I-A)\) optimization is enabled
\end{tabular}

Multivariate normal integration parameters
\begin{tabular}{rll} 
mvnMaxPointsA & \(i\) & base number of integration points \\
mvnMaxPointsB & \(i\) & number of integration points per row \\
mvnMaxPointsC & \(i\) & number of integration points per rows \(\wedge 2\) \\
mvnAbsEps & \(i\) & absolute tolerance \\
mvnRelEps & \(i\) & relative tolerance
\end{tabular}

\section*{Value}

If a model is provided, it is returned with the optimizer option either set or cleared. If value is empty, the current value is returned.

mxPath Create List of Paths

```

\section*{Description}

This function creates a list of paths.

\section*{Usage}
mxPath(from, to = NA, connect = c("single", "all.pairs", "unique.pairs", "all.bivariate", "unique.bivariate"), arrows = 1, free \(=\) TRUE, values \(=\) NA, labels = NA, lbound = NA, ubound = NA, ...)

\section*{Arguments}
\begin{tabular}{ll} 
from & character vector. These are the sources of the new paths. \\
character vector. These are the sinks of the new paths. \\
connect & \begin{tabular}{l} 
String. Specifies the type of source to sink connection: "single", "all.pairs", \\
"all.bivariate", "unique.pairs", "unique.bivariate". Default value is "single". \\
arrows
\end{tabular} \\
\begin{tabular}{l} 
numeric value. Must be either 1 (for single-headed) or 2 (for double-headed \\
arrows). \\
bree
\end{tabular} & \begin{tabular}{l} 
boolean vector. Indicates whether paths are free or fixed.
\end{tabular} \\
values & \begin{tabular}{l} 
numeric vector. The starting values of the parameters. \\
labels \\
lbound
\end{tabular} \\
ubound & \begin{tabular}{l} 
numeric vector. The lower bounds of free parameters.
\end{tabular} \\
\(\ldots\) & \begin{tabular}{l} 
numeric vector. The upper bounds of free parameters.
\end{tabular} \\
& Not used. Allows OpenMx to catch the use of the deprecated 'all' argument.
\end{tabular}

\section*{Details}

The mxPath function creates MxPath objects. These consist of a list of paths describing the relationships between variables in a model using the RAM modeling approach (McArdle and MacDonald, 1984). Variables are referenced by name, and these names must appear in the 'manifestVar' and 'latentVar' arguments of the mxModel function.
Paths are specified as going "from" one variable (or set of variables) "to" another variable or set of variables using the 'from' and 'to' arguments, respectively. If 'to' is left empty, it will be set to the value of 'from'.
'connect' has five possible connection types: "single", "all.pairs", "all.bivariate", "unique.pairs", "unique.bivariate". The default value is "single". Assuming the values c('a', 'b', 'c') for the 'to' and 'from' fields the paths produced by each connection type are as follows:
"all.pairs": (a,a), (a,b), (a,c), (b,a), (b,b), (b,c), (c,a), (c,b), (c, c).
"unique.pairs': (a,a), (a,b), (a,c), (b,b), (b,c), (c,c).
"all.bivariate": (a,b), (a,c), (b,a), (b,c), (c,a), (c, b).
'unique.bivariate": (a,b), (a,c), (b,c).
"single": (a,a), (b,b), (c,c).
Multiple variables may be input as a vector of variable names. If the 'connect' argument is set to "single", then paths are created going from each entry in the 'from' vector to the corresponding entry in the 'to' vector. If the 'to' and 'from' vectors are of different lengths when the 'connect' argument is set to "single", the shorter vector is repeated to make the vectors of equal length.

The 'free' argument specifies whether the paths created by the mxPath function are free or fixed parameters. This argument may take either TRUE for free parameters, FALSE for fixed parameters, or a vector of TRUEs and FALSEs to be applied in order to the created paths.
The 'arrows' argument specifies the type of paths created. A value of 1 indicates a one-headed arrow representing regression. This path represents a regression of the 'to' variable on the 'from' variable, such that the arrow points to the 'to' variable in a path diagram. A value of 2 indicates a two-headed arrow, representing a covariance or variance. If multiple paths are created in the same mxPath function, then the 'arrows' argument may take a vector of 1 s and 2 s to be applied to the set of created paths.

The 'values' is a numeric vectors containing the starting values of the created paths. 'values' gives a starting value for estimation. The 'labels' argument specifies the names of the resulting MxPath object. The 'lbound' and 'ubound' arguments specify lower and upper bounds for the created paths.

\section*{Value}

Returns a list of paths.

\section*{Note}

The previous implementation of 'all' had unsafe features. Its use is now deprecated, and has been replaced by the new mechanism 'connect' which supports safe and controlled generation of desired combinations of paths.

\section*{Description}

This is an internal class, the meta data for RAM.
MxRAMModel-class MxRAMModel

\section*{Description}

This is an internal class and should not be used directly.

\section*{mxRAMObjective DEPRECATED: Create MxRAMObjective Object}

\section*{Description}

WARNING: Objective functions have been deprecated as of OpenMx 2.0.
Please use mxExpectationRAM() and mxFitFunctionML() instead. As a temporary workaround, mxRAMObjective returns a list containing an MxExpectationNormal object and an MxFitFunctionML object.
All occurrences of
mxRAMObjective \((A, S, F, M=N A\), dimnames \(=N A\), thresholds \(=\) NA, vector \(=\) FALSE, threshnames \(=\) dimnames)
Should be changed to
\(m x E x p e c t a t i o n R A M(A, S, F, M=N A\), dimnames \(=N A\), thresholds \(=\) NA, threshnames \(=\) dimnames) \(m x\) FitFunctionML (vector \(=\) FALSE \()\)

\section*{Arguments}

A
S
dimnames
thresholds
vector
threshnames

F A character string indicating the name of the ' \(F\) ' matrix.
M An optional character string indicating the name of the ' M ' matrix.
A character string indicating the name of the 'A' matrix.
A character string indicating the name of the 'S' matrix.

An optional character vector to be assigned to the column names of the ' F ' and 'M' matrices.
An optional character string indicating the name of the thresholds matrix.
A logical value indicating whether the objective function result is the likelihood vector.
An optional character vector to be assigned to the column names of the thresholds matrix.

\section*{Details}

NOTE: THIS DESCRIPTION IS DEPRECATED. Please change to using mxExpectationRAM and mxFitFunctionML as shown in the example below.

Objective functions were functions for which free parameter values are chosen such that the value of the objective function was minimized. The mxRAMObjective provided maximum likelihood estimates of free parameters in a model of the covariance of a given MxData object. This model is defined by reticular action modeling (McArdle and McDonald, 1984). The 'A', 'S', and 'F' arguments must refer to MxMatrix objects with the associated properties of the A, S, and F matrices in the RAM modeling approach.

The 'dimnames' arguments takes an optional character vector. If this argument is not a single NA, then this vector be assigned to be the column names of the ' F ' matrix and optionally to the ' M ' matrix, if the ' M ' matrix exists.

The 'A' argument refers to the A or asymmetric matrix in the RAM approach. This matrix consists of all of the asymmetric paths (one-headed arrows) in the model. A free parameter in any row and column describes a regression of the variable represented by that row regressed on the variable represented in that column.
The 'S' argument refers to the \(S\) or symmetric matrix in the RAM approach, and as such must be square. This matrix consists of all of the symmetric paths (two-headed arrows) in the model. A free parameter in any row and column describes a covariance between the variable represented by that row and the variable represented by that column. Variances are covariances between any variable at itself, which occur on the diagonal of the specified matrix.
The ' \(F\) ' argument refers to the F or filter matrix in the RAM approach. If no latent variables are included in the model (i.e., the A and S matrices are of both of the same dimension as the data matrix), then the ' F ' should refer to an identity matrix. If latent variables are included (i.e., the \(A\) and \(S\) matrices are not of the same dimension as the data matrix), then the ' F ' argument should consist of a horizontal adhesion of an identity matrix and a matrix of zeros.

The ' M ' argument refers to the M or means matrix in the RAM approach. It is a 1 xn matrix, where n is the number of manifest variables + the number of latent variables. The M matrix must be specified if either the mxData type is "cov" or "cor" and a means vector is provided, or if the mxData type is "raw". Otherwise the M matrix is ignored.
The MxMatrix objects included as arguments may be of any type, but should have the properties described above. The mxRAMObjective will not return an error for incorrect specification, but incorrect specification will likely lead to estimation problems or errors in the mxRun function.
mxRAMObjective evaluates with respect to an MxData object. The MxData object need not be referenced in the mxRAMObjective function, but must be included in the MxModel object. mxRAMObjective requires that the 'type' argument in the associated MxData object be equal to 'cov' or 'cor'.

To evaluate, place MxRAMObjective objects, the mxData object for which the expected covariance approximates, referenced MxAlgebra and MxMatrix objects, and optional MxBounds and MxConstraint objects in an MxModel object. This model may then be evaluated using the mxRun function. The results of the optimization can be found in the 'output' slot of the resulting model, and may be obtained using the mxEval function..

\section*{Value}

Returns a list containing an MxExpectationRAM object and an MxFitFunctionML object.

\# Fit the model and print a summary
tmpModelOut <- mxRun(tmpModel)
summary (tmpModelOut)
mxRename Rename MxModel or a Submodel

\section*{Description}

This functions renames either the top model or a submodel to a new name. All internal references to the old model name are replaced with references to the new name.

\section*{Usage}
mxRename(model, newname, oldname = NA)

\section*{Arguments}
model a MxModel object.
newname the new name of the model.
oldname the name of the target model to rename. If NA then rename top model.

\section*{Value}

Return a mxModel object with the target model renamed.

\section*{References}

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

\section*{Examples}
```

library(OpenMx)

# create two empty models

modelA <- mxModel(model='modelA')
modelB <- mxModel(model='modelB')

# create a parent model with two submodels

modelC <- mxModel(model='modelC', modelA, modelB)

# Rename modelC to model1

model1 <- mxRename(modelC, 'model1')

# Rename submodel modelB to model2

model1 <- mxRename(model1, oldname = 'modelB', newname = 'model2')
model1

```
mxRestore Restore From Checkpoint File

\section*{Description}

The function loads the last saved state from a checkpoint file.

\section*{Usage}
mxRestore(model, chkpt.directory = ".", chkpt.prefix = "")

\section*{Arguments}
```

    model MxModel object to be loaded.
    chkpt.directory
            character. Directory where the checkpoint file is located.
    chkpt.prefix character. Prefix of the checkpoint file.
    ```

\section*{Details}

In general, the arguments 'chkpt.directory' and 'chkpt.prefix' should be identical to the mxOption: 'Checkpoint Directory' and 'Checkpoint Prefix' that were specificed on the model before execution.
Alternatively, the checkpoint file can be manually loaded as a data.frame in R. Use read.table with the options header=TRUE, sep="\t", stringsAsFactors=FALSE, check.names=FALSE.

\section*{Value}

Returns an MxModel object with free parameters updated to the last saved values.

\section*{References}

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

\section*{Examples}
```

library(OpenMx)

# Simulate some data

x=rnorm(1000, mean=0, sd=1)
y= 0.5*x + rnorm(1000, mean=0, sd=1)
tmpFrame <- data.frame(x, y)
tmpNames <- names(tmpFrame)

# Create a model that includes an expected covariance matrix,

# an expectation function, a fit function, and an observed covariance matrix

data <- mxData(cov(tmpFrame), type="cov", numObs = 1000)
expCov <- mxMatrix(type="Symm", nrow=2, ncol=2, values=c(.2,.1,.2), free=TRUE, name="expCov")
expFunction <- mxExpectationNormal(covariance="expCov", dimnames=tmpNames)
fitFunction <- mxFitFunctionML()
testModel <- mxModel(model="testModel", expCov, data, expFunction, fitFunction)
\#Use mxRun to optimize the free parameters in the expected covariance matrix
modelOut <- mxRun(testModel, checkpoint = TRUE)
modelOut$expCov
#Use mxRestore to load the last checkpoint saved state of the model
modelRestore <- mxRestore(testModel)
modelRestore$expCov

```

\section*{Description}

WARNING: Objective functions have been deprecated as of OpenMx 2.0.
Please use \(m x F i t F u n c t i o n R()\) instead. As a temporary workaround, mxRObjective returns a list containing a NULL MxExpectation object and an MxFitFunctionR object.
All occurrences of
mxRObjective(fitfun, ...)
Should be changed to
mxFitFunctionR(fitfun, ...)

\section*{Arguments}
objfun A function that accepts two arguments.
... The initial state information to the objective function.

\section*{Details}

NOTE: THIS DESCRIPTION IS DEPRECATED. Please change to using mxExpectationNormal and \(m x F i t F u n c t i o n M L\) as shown in the example below.

The fitfun argument must be a function that accepts two arguments. The first argument is the mxModel that should be evaluated, and the second argument is some persistent state information that can be stored between one iteration of optimization to the next iteration. It is valid for the function to simply ignore the second argument.
The function must return either a single numeric value, or a list of exactly two elements. If the function returns a list, the first argument must be a single numeric value and the second element will be the new persistent state information to be passed into this function at the next iteration. The single numeric value will be used by the optimizer to perform optimization.

The initial default value for the persistant state information is NA.
Throwing an exception (via stop) from inside fitfun may result in unpredictable behavior. You may want to wrap your code in tryCatch while experimenting.

\section*{Value}

Returns a list containing a NULL mxExpectation object and an MxFitFunctionR object.

\section*{References}

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

\section*{Examples}
```

# Create and fit a model using mxFitFunctionR

library(OpenMx)
A <- mxMatrix(nrow = 2, ncol = 2, values = c(1:4), free = TRUE, name = 'A')
squared <- function(x) { x ^ 2 }

# Define the objective function in R

objFunction <- function(model, state) {
values <- model$A$values
return(squared(values[1,1] - 4) + squared(values[1,2] - 3) +
squared(values[2,1] - 2) + squared(values[2,2] - 1))
}

# Define the expectation function

fitFunction <- mxFitFunctionR(objFunction)

# Define the model

tmpModel <- mxModel(model="exampleModel", A, fitFunction)

# Fit the model and print a summary

tmpModelOut <- mxRun(tmpModel)
summary(tmpModelOut)

```
mxRowObjective DEPRECATED: Create MxRowObjective Object

\section*{Description}

WARNING: Objective functions have been deprecated as of OpenMx 2.0.
Please use mxFitFunctionRow() instead. As a temporary workaround, mxRowObjective returns a list containing a NULL MxExpectation object and an MxFitFunctionRow object.
All occurrences of
\(m x R o w O b j e c t i v e(r o w A l g e b r a\), reduceAlgebra, dimnames, rowResults = "rowResults", filteredDataRow = "filteredDataRow", existenceVector = "existenceVector")

Should be changed to
\(m x F i t F u n c t i o n R o w(r o w A l g e b r a\), reduceAlgebra, dimnames, rowResults = "rowResults", filteredDataRow = "filteredDataRow", existenceVector = "existenceVector")

\section*{Arguments}
rowAlgebra A character string indicating the name of the algebra to be evaluated row-wise.
reduceAlgebra A character string indicating the name of the algebra that collapses the row results into a single number which is then optimized.
dimnames A character vector of names corresponding to columns be extracted from the data set.
rowResults The name of the auto-generated "rowResults" matrix. See details.
filteredDataRow
The name of the auto-generated "filteredDataRow" matrix. See details.
existenceVector
The name of the auto-generated "existenceVector" matrix. See details.

\section*{Details}

Objective functions are functions for which free parameter values are chosen such that the value of the objective function is minimized. The mxRowObjective function evaluates a user-defined MxAlgebra object called the 'rowAlgebra' in a row-wise fashion. It then stores results of the rowwise evaluation in another MxAlgebra object called the 'rowResults'. Finally, the mxRowObjective function collapses the row results into a single number which is then used for optimization. The MxAlgebra object named by the 'reduceAlgebra' collapses the row results into a single number.
The 'filteredDataRow' is populated in a row-by-row fashion with all the non-missing data from the current row. You cannot assume that the length of the filteredDataRow matrix remains constant (unless you have no missing data). The 'existenceVector' is populated in a row-by-row fashion with a value of 1.0 in column \(j\) if a non-missing value is present in the data set in column \(j\), and a value of 0.0 otherwise. Use the functions omxSelectRows, omxSelectCols, and omxSelectRowsAndCols to shrink other matrices so that their dimensions will be conformable to the size of 'filteredDataRow'.

\section*{Value}

Please use mxFitFunctionRow() instead. As a temporary workaround, mxRowObjective returns a list containing a NULL MxExpectation object and an MxFitFunctionRow object.

\section*{References}

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

\section*{Examples}
```

# Model that adds two data columns row-wise, then sums that column

# Notice no optimization is performed here.

library(OpenMx)
xdat <- data.frame(a=rnorm(10), b=1:10) \# Make data set
amod <- mxModel(model="example1",
mxData(observed=xdat, type='raw'),
mxAlgebra(sum(filteredDataRow), name = 'rowAlgebra'),
mxAlgebra(sum(rowResults), name = 'reduceAlgebra'),

```
```

        mxFitFunctionRow(
            rowAlgebra='rowAlgebra',
            reduceAlgebra='reduceAlgebra',
            dimnames=c('a','b'))
    )
amodOut <- mxRun(amod)
mxEval(rowResults, model=amodOut)
mxEval(reduceAlgebra, model=amodOut)

# Model that find the parameter that minimizes the sum of the

# squared difference between the parameter and a data row.

bmod <- mxModel(model="example2",
mxData(observed=xdat, type='raw'),
mxMatrix(values=.75, ncol=1, nrow=1, free=TRUE, name='B'),
mxAlgebra((filteredDataRow - B) ^ 2, name='rowAlgebra'),
mxAlgebra(sum(rowResults), name='reduceAlgebra'),
mxFitFunctionRow(
rowAlgebra='rowAlgebra',
reduceAlgebra='reduceAlgebra',
dimnames=c('a'))
)
bmodOut <- mxRun(bmod)
mxEval(B, model=bmodOut)
mxEval(reduceAlgebra, model=bmodOut)
mxEval(rowResults, model=bmodOut)

```
mxRun Send a Model to the Optimizer

\section*{Description}

This function begins optimization on the top-level model.

\section*{Usage}
mxRun(model, ..., intervals = NULL, silent = FALSE, suppressWarnings = FALSE, unsafe \(=\) FALSE, checkpoint \(=\) FALSE, useSocket \(=\) FALSE, onlyFrontend \(=\) FALSE, useOptimizer = TRUE)

\section*{Arguments}
\[
\begin{array}{ll}
\text { model } & \text { A MxModel object to be optimized. } \\
\ldots & \text { Not used. Forces remaining arguments to be specified by name. } \\
\text { intervals } & \text { A boolean indicating whether to compute the specified confidence intervals. } \\
\text { silent } & \text { A boolean indicating whether to print status to terminal. } \\
\text { suppressWarnings }
\end{array}
\]

A boolean indicating whether to suppress warnings.
\begin{tabular}{ll} 
unsafe & A boolean indicating whether to ignore errors. \\
checkpoint & A boolean indicating whether to periodically write parameter values to a file. \\
useSocket & A boolean indicating whether to periodically write parameter values to a socket. \\
onlyFrontend & \begin{tabular}{l} 
A boolean indicating whether to run only front-end model transformations.
\end{tabular} \\
useOptimizer & \begin{tabular}{l} 
A boolean indicating whether to run only the log-likelihood of the current free \\
parameter values but not move any of the free parameters.
\end{tabular}
\end{tabular}

\section*{Details}

The mxRun function is used to optimize free parameters in MxModel objects based on an expectation function and fit function. MxModel objects included in the mxRun function must include an appropriate expectation and fit functions.
If the 'silent' flag is TRUE, then model execution will not print any status messages to the terminal.
If the 'suppressWarnings' flag is TRUE, then model execution will not issue a warning if NPSOL returns a non-zero status code.
If the 'unsafe' flag is TRUE, then any error conditions will throw a warning instead of an error. It is strongly recommended to use this feature only for debugging purposes.

Free parameters are estimated or updated based on the expectation and fit functions. These estimated values, along with estimation information and model fit, can be found in the 'output' slot of MxModel objects after mxRun has been used.
If a model is dependent on or shares parameters with another model, both models must be included as arguments in another MxModel object. This top-level MxModel object must include expectation and fit functions in both submodels, as well as an additional fit function describing how the results of the first two should be combined.

\section*{Value}

Returns an MxModel object with free parameters updated to their final values. The return value contains an "output" slot with the results of optimization.

\section*{References}

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

\section*{Examples}
```

# Create and run the 1-factor CFA on the openmx.psyc.virginia.edu front page

library(OpenMx)
data(demoOneFactor) \# load the demoOneFactor dataframe
manifests <- names(demoOneFactor) \# set the manifest to the 5 demo variables
latents <- c("G") \# define 1 latent variable
model <- mxModel(model="One Factor", type="RAM",
manifestVars = manifests,
latentVars = latents,

```
```

    mxPath(from=latents, to=manifests, labels=paste("b", 1:5, sep="")),
    mxPath(from=manifests, arrows=2, labels=paste("u", 1:5, sep="")),
    mxPath(from=latents , arrows=2, free=FALSE, values=1.0),
    mxData(cov(demoOneFactor), type="cov", numObs=500)
    )
model <- mxRun(model) \# Run the model, returning the result into model
summary(model) \# Show summary of the fitted model

```
    mxSave Save End State to Checkpoint File

\section*{Description}

The function saves the last state of a model to a checkpoint file.

\section*{Usage}
mxSave(model, chkpt.directory = ".", chkpt.prefix = "")

\section*{Arguments}
model MxModel object to be loaded.
chkpt.directory character. Directory where the checkpoint file is located.
chkpt.prefix character. Prefix of the checkpoint file.

\section*{Details}

In general, the arguments 'chkpt.directory' and 'chkpt.prefix' should be identical to the mxOption: 'Checkpoint Directory' and 'Checkpoint Prefix' that were specificed on the model before execution.
Alternatively, the checkpoint file can be manually loaded as a data.frame in R. Use read.table with the options header=TRUE, sep="\t", stringsAsFactors=FALSE, check.names=FALSE.

\section*{Value}

Returns a logical indicating the succes of writing the checkpoint file to the checkpoint directory.

\section*{References}

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

\section*{Examples}
```

library(OpenMx)

# Simulate some data

x=rnorm(1000, mean=0, sd=1)
y= 0.5*x + rnorm(1000, mean=0, sd=1)
tmpFrame <- data.frame(x, y)
tmpNames <- names(tmpFrame)

# Create a model that includes an expected covariance matrix,

# an expectation function, a fit function, and an observed covariance matrix

data <- mxData(cov(tmpFrame), type="cov", numObs = 1000)
expCov <- mxMatrix(type="Symm", nrow=2, ncol=2, values=c(.2,.1,.2), free=TRUE, name="expCov")
expFunction <- mxExpectationNormal(covariance="expCov", dimnames=tmpNames)
fitFunction <- mxFitFunctionML()
testModel <- mxModel(model="testModel", expCov, data, expFunction, fitFunction)
\#Use mxRun to optimize the free parameters in the expected covariance matrix
modelOut <- mxRun(testModel)
modelOut\$expCov

# Save the ending state of modelOut in a checkpoint file

mxSave(modelOut)

# Restore the saved model from the checkpoint file

modelSaved <- mxRestore(testModel)
modelSaved\$expCov

# Imagine how much time you saved by not having to re-run the

# model that took hours or days to run.

```
mxSetDefaultOptions Reset global options to the default

\section*{Description}

Reset global options to the default

\section*{Usage}
mxSetDefaultOptions()

\section*{Description}

Vectors are filled column-by-column into a matrix. Shorter vectors are padded with NAs to fill whole columns.

\section*{Usage}
mxSimplify2Array(x, higher = FALSE)

\section*{Arguments}
x
higher
a list of vectors
whether to produce a higher rank array (defaults to FALSE)

\section*{Examples}
```

v1 <- 1:3
v2 <- 4:5
v3<- 6:10
mxSimplify2Array(list(v1,v2,v3))

# [,1] [,2] [,3]

# [1,] 1 4 6

# [2,] 2 5 7

# [3,] 3 NA 8

# [4,] NA NA 9

\#[5,] NA NA 10

```
mxStandardizeRAMpaths Standardize RAM models' path coefficients

\section*{Description}

Provides a dataframe containing the standardized values of all nonzero path coefficients appearing in the \(A\) and \(S\) matrices of models that use RAM expectation (either of type="RAM" or containing an explicit mxExpectationRAM() statement). These standardized values are what the path coefficients would be if all variables in the analysis-both manifest and latent-were standardized to unit variance. Can optionally include asymptotic standard errors for those standardized coefficients, computed via the delta method.

\section*{Usage}
mxStandardizeRAMpaths(model, SE=FALSE)

\section*{Arguments}
model An mxModel object, that either uses RAM expectation or contains at least one submodel that does.

SE Logical. Should standard errors be included with the standardized point estimates? Defaults to FALSE. Certain conditions are required for use of \(S E=T R U E\); see "Details" below.

\section*{Details}

Matrix A contains the Asymmetric paths, i.e. the single-headed arrows. Matrix S contains the Symmetric paths, i.e. the double-headed arrows. The function will work even if mxMatrix objects named "A" and "S" are absent from the model, since it identifies which matrices in the model have been assigned the roles of A and S in the mxExpectationRAM statement. Note that, in models of type="RAM", the necessary matrices and expectation statement are automatically assembled from the mxPath objects.

If model contains any submodels with independent=TRUE that use RAM expectation, mxStandardizeRAMpaths() automatically applies itself recursively over those submodels.

Use of SE=TRUE requires that package numDeriv be installed. It also requires that model contain no \(m x\) Constraint statements, and have a nonempty hessian element in its output slot. There are three common reasons why the latter condition may not be met. First, the model may not have been run yet, i.e. it was not output by mxRun(). Second, mxOption "Hessian" might be set to "No". Third, computing the Hessian matrix might possibly have been skipped per a user-defined mxCompute* statement (if any are present in the model). If model contains RAM-expectation submodels with independent=TRUE, these conditions are checked separately for each such submodel.

In any event, using these standard errors for hypothesis-testing or forming confidence intervals is not generally advised. Instead, it is considered best practice to conduct likelihood-ratio tests or compute likelihood-based confidence intervals (from mxCI() ), as in examples below.
The user should note that mxStandardizeRAMpaths() only cares whether an element of A or S is nonzero, and not whether it is a fixed or free parameter. So, for instance, if the function is used on a model not yet run, any free parameters in A or S initialized at zero will not appear in the function's output.

The user is warned to interpret the output of mxStandardizeRAMpaths() cautiously if any elements of \(A\) or \(S\) depend upon definition variables.

\section*{Value}

If argument model is a single-group model that uses RAM expecation, then mxStandardizeRAMpaths() returns a dataframe, with one row for each nonzero path coefficient in A and S, and with the following columns:
name Character strings that uniquely identify each nonzero path coefficient in terms of the model name, the matrix (" A " or " S "), the row number, and the column number.
label
Character labels for those path coefficients that are labeled elements of an mxMatrix object, and NA for those that are not. Note that path coefficients having the same
label (and therefore the same UNstandardized value) can have different standardized values, and therefore the same label may appear more than once in this dataframe.
matrix Character strings of "A" or "S", depending on which matrix contains the given path coefficient.
row Character. The rownames of the matrix containing each path coefficient; row numbers are used instead if the matrix has no rownames.
col Character. The colnames of the matrix containing each path coefficient; column numbers are used instead if the matrix has no colnames.

Raw. Value Numeric values of the raw (i.e., UNstandardized) path coefficients.
Raw. SE Numeric values of the asymptotic standard errors of the raw path coefficients if if SE=TRUE, or NA otherwise.

Std.Value Numeric values of the standardized path coefficients.
Std.SE Numeric values of the asymptotic standard errors of the standardized path coefficients if SE=TRUE, or NA otherwise.

If model is a multi-group model containing at least one submodel with RAM expectation, then \(m x S t a n d a r d i z e R A M p a t h s()\) returns a list. The list has a number of elements equal to the number of submodels that either have RAM expectation or contain a submodel that does. List elements corresponding to RAM-expectation submodels contain a dataframe, as described above. List elements corresponding to "container" submodels are themselves lists, of the kind described here.

\section*{Examples}
```

library(OpenMx)
data(demoOneFactor)
manifests <- names(demoOneFactor)
latents <- c("G")
factorModel <- mxModel(model="One Factor", type="RAM",
manifestVars = manifests,
latentVars = latents,
mxPath(from=latents, to=manifests),
mxPath(from=manifests, arrows=2, values=0.1),
mxPath(from=latents, arrows=2,free=FALSE, values=1.0),
mxData(cov(demoOneFactor), type="cov",numObs=500)
)
factorFit <-mxRun(factorModel)
summary(factorFit)\$parameters
mxStandardizeRAMpaths(model=factorFit,SE=FALSE)

## Likelihood ratio test of variable x1's factor loading:

factorModelNull <- omxSetParameters(factorModel,labels="One Factor.A[1,6]",
values=0, free=FALSE)
factorFitNull <- mxRun(factorModelNull)
mxCompare(factorFit,factorFitNull)[2,"p"] \#<--p-value

## Confidence intervals for all standardized paths:

factorModel2 <- mxModel(model=factorModel,
mxMatrix(type="Iden",nrow=nrow(factorModel\$A), name="I"),

```
```

        mxAlgebra( vec2diag(diag2vec( solve(I-A)%*%S%*%t(solve(I-A)) )%^%-0.5) ,
            name="InvSD"),
    mxAlgebra( InvSD %*% A %*% solve(InvSD),
            name="Az",dimnames=dimnames(factorModel$A)),
        mxAlgebra( InvSD %*% S %*% InvSD,
                        name="Sz",dimnames=dimnames(factorModel$S)),
        mxCI(c("Az","Sz"))
    )
factorFit2 <- mxRun(factorModel2,intervals=TRUE)

## Contains point values and confidence limits for all paths:

summary(factorFit2)\$CI

```
mxThreshold Create List of Thresholds

\section*{Description}

This function creates a list of thresholds.

\section*{Usage}
mxThreshold(vars, nThresh=NA, free=FALSE, values=NA, labels=NA, lbound=NA, ubound=NA)

\section*{Arguments}
vars character vector. These are the variables for which thresholds are to be specified.
nThresh numeric vector. These are the number of thresholds for each variables listed in 'vars'.
free boolean vector. Indicates whether threshold parameters are free or fixed.
values numeric vector. The starting values of the parameters.
labels character vector. The names of the parameters.
lbound numeric vector. The lower bounds of free parameters.
ubound numeric vector. The upper bounds of free parameters.

\section*{Details}

The mxPath function creates MxThreshold objects. These consist of a list of ordinal variables and the thresholds that define the relationship between the observed ordinal variable and the continuous latent variable assumed to underly it. This function directly mirrors the usage of mxPath, but is used to specify thresholds rather than means, variances and bivariate relationships.

The 'vars' argument specifies which variables you wish to specify thresholds for. Variables are referenced by name, and these names must appear in the 'manifestVar' argument of the mxModel function if thresholds are to be correctly processed. Additionally, variables for which thresholds are specified must be specified as ordinal factors in whatever data is included in the model.

The 'nThresh' argument specifies how many thresholds are to be specified for the variable or variables included in the 'vars' argument. The number of thresholds for a particular variable should be one fewer than the number of categories specified for that variable.

The 'free' argument specifies whether the thresholds created by the mxThreshold function are free or fixed parameters. This argument may take either TRUE for free parameters, FALSE for fixed parameters, or a vector of TRUEs and FALSEs to be applied in order to the created thresholds.
The 'values' is a numeric vectors containing the starting values of the created thresholds. 'values' gives a starting value for estimation. The 'labels' argument specifies the names of the parameters in the resulting MxThreshold object. The 'lbound' and 'ubound' arguments specify lower and upper bounds for the created threshold parameters.

Thresholds for multiple variables may be specified simultaneously by including a vector of variable names to the 'vars' argument. When multiple variables are included in the 'vars' argument, the length of the 'vars' argument must be evenly divisable by the length of the 'nThresh' argument. All subsequent arguments ('free' through 'ubound') should have their lengths be a factor of the total number of thresholds specified for all variables.

If four variables are included in the 'vars' argument, then the 'nThresh' argument should contain either one, two or four elements. If the 'nThresh' argument specifies two thresholds for each variable, then 'free', 'values', and all subsequent arguments should specify eight values by including one, two, four or eight elements. Whenever fewer values are specified than are required (e.g., specify two values for eight thresholds), then the entire vector of values is repeated until the required number of values is reached, and will return an error if the correct number of values cannot be achieved by repeating the entire vector.

\section*{Value}

Returns a list of thresholds.

```
mxPath for comparable specification of paths. mxMatrix for a matrix-based approach to thresholds specification; mxModel for the container in which mxThresholds are embedded. More information about the OpenMx package may be found here.

\footnotetext{
mxTryHard
Make multiple attempts to run a model
}

\section*{Description}

Makes multiple attempts to fit an MxModel object with mxRun() until the optimizer yields an acceptable solution or the maximum number of attempts is reached. Each attempt uses the parameter estimates of the previous attempt as start values, except they are each multiplied by random draws from a uniform distribution. From among its attempts, the function returns the fitted, post-mxRun() model with the smallest fit-function value, and prints to the console the start values it used for that model.
```

Usage
mxTryHard(model, extraTries = 10, greenOK = FALSE, loc = 1,
scale = 0.25, checkHess = TRUE, fit2beat = Inf, paste = TRUE,
iterationSummary=FALSE, bestInitsOutput=TRUE, showInits=FALSE,
...)

```

\section*{Arguments}
model The model to be run; object of class MxModel.
extraTries The number of attempts to run the model in addition to the first. In effect, is the maximum number of attempts \(m x T r y H a r d()\) will make, since the function will stop once an acceptable solution is reached. Defaults to 10 , in which case a maximum of 11 total attempts will be made.
greenOK Logical; is a solution with Mx status GREEN (npsolstatus=1) acceptable? Defaults to FALSE.
loc, scale The location and scale parameters of the uniform (rectangular) distribution from which random values are drawn to disturb start values between attempts. The location parameter is the distribution's median, and the scale parameter is the half-width of the rectangle (that is, the absolute difference between the median and the extrema). Defaults to a uniform distribution on the interval \((0.75,1.25)\).
checkHess Logical; is a positive-definite Hessian a requirement for an acceptable solution? Defaults to TRUE.
fit2beat An upper limit to the objective-function value that an acceptable solution may have. Useful if a nested submodel of model has already been fitted, since model, with its additional free parameters, should not yield a fit-function value any greater than that of the submodel.
paste Logical. If TRUE (default), start values for the returned fitted model are printed to console as a comma-separated string. This is useful if the user wants to copypaste these values into an \(R\) script, say, in an omxSetParameters() statement. If FALSE, the vector of start values is printed as-is. Note that this vector, from omxGetParameters(), has names corresponding to the free parameters; these names are not displayed when paste=TRUE.
iterationSummary
Logical. If TRUE, displays parameter estimates and fit values for every fit attempt. Defaults to FALSE.
bestInitsOutput
Logical. If TRUE, outputs starting values that resulted in best fit, according to format specified by paste argument. Defaults to TRUE.
showInits Logical. If TRUE, displays starting values for every fit attempt. Defaults to FALSE.
... Additional arguments to be passed to mxRun() (for example, intervals=TRUE). Note that mxTryHard() always internally invokes mxRun() with argument suppressWarnings=TRUE.

\section*{Value}

Usually, mxTryHard() returns a post-mxRun() MxModel object. Specifically, this will be the fitted model having the smallest fit-function value found by mxTryHard() during its attempts. The start values used to obtain this fitted model are printed to console.

If every attempt at running model fails, mxTryHard() returns an object of class 'try-error', and the start values from the last attempt are printed to console.
\(m x \operatorname{TryHard}()\) throws a warning if the returned MxModel object has a nonzero npsolstatus.

\section*{See Also}
mxRun()

\section*{Examples}
```

library(OpenMx)
data(demoOneFactor) \# load the demoOneFactor dataframe
manifests <- names(demoOneFactor) \# set the manifest to the 5 demo variables
latents <- c("G") \# define 1 latent variable
model <- mxModel(model="One Factor", type="RAM",
manifestVars = manifests,
latentVars = latents,
mxPath(from=latents, to=manifests, labels=paste("b", 1:5, sep="")),
mxPath(from=manifests, arrows=2, labels=paste("u", 1:5, sep="")),
mxPath(from=latents , arrows=2, free=FALSE, values=1.0),
mxData(cov(demoOneFactor), type="cov", numObs=500)
)
model <- mxTryHard(model) \# Run the model, returning the result into model
summary(model) \# Show summary of the fitted model

```
mxTypes

List Currently Available Model Types

\section*{Description}

This function returns a vector of the currently available type names.

\section*{Usage}
mxTypes()

\section*{Value}

Returns a character vector of type names.

\section*{Examples}
mxTypes()
```

mxVersion

```

Returns Current Version String

\section*{Description}

This function returns a string with the current version number of OpenMx. Optionally (with verbose \(=\) TRUE (the default)), it prints a message containing the version of R, the platform, and the optimiser.

\section*{Usage}
mxVersion(model \(=\) NULL, verbose \(=\) TRUE)

\section*{Arguments}
model optional MxModel to request optimizer from \((\) default \(=\) NULL \()\)
verbose \(\quad\) Whether to print version information to the console \((\) default \(=\) TRUE \()\)

\section*{References}

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

\section*{Examples}
```

# Print useful version information.

mxVersion()

# If you just want the version, use this call.

x = mxVersion(verbose=FALSE)
library(OpenMx)
data(demoOneFactor) \# load the demoOneFactor dataframe

latents <- c("G") \# define 1 latent variable
model <- mxModel(model = "One Factor", type = "RAM",
manifestVars = manifests,
latentVars = latents,
mxPath(from = latents, to = manifests, labels = paste("b", 1:5, sep = "")),
mxPath(from = manifests, arrows = 2 , labels = paste("u", 1:5, sep = "")),
mxPath(from = latents , arrows = 2 , free = FALSE, values = 1.0),
mxData(cov(demoOneFactor), type = "cov", numObs = 500)

```
)
mxVersion(model, verbose = TRUE)
myAutoregressiveData Example data with autoregressively related columns

\section*{Description}

Data set used in some of OpenMx's examples.

\section*{Usage}
data("myAutoregressiveData")

\section*{Format}

A data frame with 100 observations on the following variables.
x 1 x variable and time 1
x 2 x variable and time 2
\(x 3 \mathrm{x}\) variable and time 3
x 4 x variable and time 4
x 5 x variable and time 5

\section*{Details}

The rows are independently and identically distributed, but the columns are and auto-correlation structure.

\section*{Source}

Simulated.

\section*{References}

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

\section*{Examples}
```

data(myAutoregressiveData)
round(cor(myAutoregressiveData), 2)

# note the sub-diagonal correlations (lag 1)

# x1-x2, x2-x3, x3-x4, x4-x5

# and the second sub-diagonal correlations (lag 2)

# x1-x3, x2-x4, x3-x5

```
myFADataRaw Example 500-row dataset with 12 generated variables

\section*{Description}

Twelve columns of generated numeric data: x1 x2 x 3 x 4 x 5 x 6 y 1 y 2 y 3 z 1 z 2 z 3 .

\section*{Usage}
data(myFADataRaw)

\section*{Details}

The x variables intercorrelate around .6 with each other.
The \(y\) variables intercorrelate around .5 with each other, and correlate around .3 with the X vars.
There are three ordinal variables, \(\mathrm{z} 1, \mathrm{z} 2\), and z 3 .
The data are used in some OpenMx examples, especially confirmatory factor analysis.
There are no missing data.

\section*{Examples}
data(myFADataRaw)
str(myFADataRaw)
myGrowthKnownClassData
Data for a growth mixture model with the true class membership

\section*{Description}

Data set used in some of OpenMx's examples.

\section*{Usage}
data("myGrowthKnownClassData")

\section*{Format}

A data frame with 500 observations on the following variables.
x 1 x variable and time 1
\(x 2 \mathrm{x}\) variable and time 2
x 3 x variable and time 3
\(x 4 \times\) variable and time 4
x 5 x variable and time 5
c Known class membership variable

\section*{Details}

The same as myGrowthMixtureData, but with the class membership variable.

\section*{Source}

Simulated.

\section*{References}

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

\section*{Examples}
```

data(myGrowthKnownClassData)
\#plot the observed trajectories

# blue lines are class 1, green lines are class 2

colSel <-c('blue', 'green')[myGrowthKnownClassData\$c]
matplot(t(myGrowthKnownClassData[,-6]), type='l', lty=1, col=colSel)

```
myGrowthMixtureData Data for a growth mixture model

\section*{Description}

Data set used in some of OpenMx's examples.

\section*{Usage}
data("myGrowthMixtureData")

\section*{Format}

A data frame with 500 observations on the following variables.
x 1 x variable and time 1
x 2 x variable and time 2
x 3 x variable and time 3
x 4 x variable and time 4
\(x 5 x\) variable and time 5

\section*{Details}

The same as myGrowthKnownClassData, but without the class membership variable.

\section*{Source}

Simulated.

\section*{References}

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

\section*{Examples}
```

data(myGrowthMixtureData)
matplot(t(myGrowthMixtureData), type='l', lty=1)
data(myGrowthKnownClassData)
all(myGrowthKnownClassData[,-6]==myGrowthMixtureData)

```
myLongitudinalData Data for a linear latent growth curve model

\section*{Description}

Data set used in some of OpenMx's examples.

\section*{Usage}
data("myLongitudinalData")

\section*{Format}

A data frame with 500 observations on the following variables.
x 1 x variable and time 1
x 2 x variable and time 2
\(x 3 x\) variable and time 3
\(x 4 x\) variable and time 4
\(x 5 \mathrm{x}\) variable and time 5

\section*{Details}

Linear growth model with mean intercept around 10, and slope of about 1.5.

Source
Simulated.

\section*{References}

```
myRegData Example regression data with correlated predictors

\section*{Description}

Data set used in some of OpenMx's examples.

\section*{Usage}
data("myRegData")

\section*{Format}

A data frame with 100 observations on the following variables.
w Predictor variable
x Predictor variable
y Predictor variable
z Outcome varialbe

\section*{Details}
\(\mathrm{w}, \mathrm{x}\), and y are predictors of \(\mathrm{z} . \mathrm{x}\) and y are correlated.

\section*{Source}

Simulated.

\section*{References}

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

\section*{Examples}
```

data(myRegData)
summary(lm(z ~ ., data=myRegData))

```

\section*{Description}

Data set used in some of OpenMx's examples.

\section*{Usage}
data("myRegDataRaw")

\section*{Format}

A data frame with 100 observations on the following variables.
w Predictor variable
x Predictor variable
y Predictor variable
z Outcome varialbe

\section*{Details}
\(\mathrm{w}, \mathrm{x}\), and y are predictors of \(\mathrm{z} . \mathrm{x}\) and y are correlated. Equal to myRegData.

\section*{Source}

Simulated.

\section*{References}

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

\section*{Examples}
```

data(myRegData)
data(myRegDataRaw)
all(myRegDataRaw == myRegData)

```
```

myTwinData Twin data on weight and height

```

\section*{Description}

Data set used in some of OpenMx's examples.

\section*{Usage}
data("myTwinData")

\section*{Format}

A data frame with 3808 observations on the following variables.
fam Family ID variable
age Age of the twin pair. Range: 17 to 88.
zyg Integer codes for zygosity and gender combinations
part
wt1 Weight in kilograms for twin 1
wt2 Weight in kilograms for twin 2
ht1 Height in meters for twin 1
ht2 Height in meters for twin 2
htwt1 Product of ht and wt for twin 1
htwt2 Product of ht and wt for twin 2
bmi1 Body Mass Index for twin 1
bmi2 Body Mass Index for twin 2

\section*{Details}

Height and weight are highly correlated, and each individually highly heritable. These data present and opportunity for multivariate behavior genetics modeling.

Named-entity Named Entities

\section*{Description}

A named entity is an S 4 object that can be referenced by name.

\section*{Details}

Every named entity is guaranteed to have a slot called "name". Within a model, the named entities of that model can be accessed using the \(\$\) operator. Access is limited to one nesting depth, such that if ' B ' is a submodel of ' A ', and ' C ' is a matrix of ' B ', then ' C ' must be accessed using \(\mathrm{A} \$ \mathrm{~B} \$ \mathrm{C}\).
The following S4 classes are named entities in the OpenMx library: MxAlgebra, MxConstraint, MxMatrix, MxModel, MxData, and MxObjective.

\section*{Examples}
library (OpenMx)
\# Create a model, add a matrix to it, and then access the matrix by name.
testModel <- mxModel(model="anEmptyModel")
testMatrix <- mxMatrix(type="Full", nrow=2, ncol=2, values=c \((1,2,3,4)\), name="yourMatrix")
yourModel <- mxModel(testModel, testMatrix, name="noLongerEmpty")
yourModel\$yourMatrix

omxAllInt

All Interval Multivariate Normal Integration

\section*{Description}
omxAllInt computes the probabilities of a large number of cells of a multivariate normal distribution that has been sliced by a varying number of thresholds in each dimension. While the same functionality can be achieved by repeated calls to omxMnor, omxAllInt is more efficient for repeated operations on a single covariance matrix. omxAllInt returns an nx1 matrix of probabilities cycling from lowest to highest thresholds in each column with the rightmost variable in covariance changing most rapidly.

\section*{Usage}
omxAllInt(covariance, means, ...)

\section*{Arguments}
covariance the covariance matrix describing the multivariate normal distribution.
means a row vector containing means of the variables of the underlying distribution.
a matrix or set of matrices containing one column of thresholds for each column of covariance. Each column must contain a strictly increasing set of thresholds for the corresponding variable of the underlying distribution. NA values in these thresholds indicate that the list of thresholds in that column has ended.

\section*{Details}
covariance and means contain the covariances and means of the multivariate distribution from which probabilities are to be calculated.
covariance must be a square covariance or correlation matrix with one row and column for each variable.
means must be a vector of length nrows(covariance) that contains the mean for each corresponding variable.
All further arguments are considered threshold matrices.
Threshold matrices contain locations of the hyperplanes delineating the intervals to be calculated. The first column of the first matrix corresponds to the thresholds for the first variable represented by the covariance matrix. Subsequent columns of the same matrix correspond to thresholds for subsequent variables in the covariance matrix. If more variables exist in the covariance matrix than in the first threshold matrix, the first column of the second threshold matrix will be used, and so on. That is, if covariance is a \(4 \times 4\) matrix, and the three threshold matrices are specified, one with a single column and the others with two columns each, the first column of the first matrix will contain thresholds for the first variable in covariance, the two columns of the second matrix will correspond to the second and third variables of covariance, respectively, and the first column of the third threshold matrix will correspond to the fourth variable. Any extra columns will be ignored.
Each column in the threshold matrices must contain some number of strictly increasing thresholds, delineating the boundaries of a cell of integration. That is, if the integral from -1 to 0 and 0 to 1 are required for a given variable, the corresponding threshold column should contain the values \(-1,0\), and 1 , in that order. Thresholds may be set to Inf or -Inf if a boundary at positive or negative infinity is desired.

Within a threshold column, a value of +Inf, if it exists, is assumed to be the largest threshold, and any rows after it are ignored in that column. A value of NA, if it exists, indicates that there are no further thresholds in that column, and is otherwise ignored. A threshold column consisting of only + Inf or NA values will cause an error.
For all \(\mathrm{i}>1\), the value in row i must be strictly larger than the value in row i-1 in the same column.
The return value of omxAllInt is a matrix consisting of a single column with one row for each combination of threshold levels.

dimnames(x)[[1]] <- letters[1:8]
omxApply(x, 2, mean, trim = .2)

```
omxAssignFirstParameters

Assign First Available Values to Model Parameters

\section*{Description}

Sometimes you may have a free parameter with two different starting values in your model. OpenMx will not run a model until all instances of a free parameter have the same starting value. It is often sufficient to arbitrarily select one of those starting values for optimization.
This function accomplishes that task of assigning valid starting values to the free parameters of a model. It selects an arbitrary current value (the "first" value it finds, where "first" is not defined) for each free parameter and uses that value for all instances of that parameter in the model.

\section*{Usage}
omxAssignFirstParameters(model, indep \(=\) FALSE)

\section*{Arguments}
\begin{tabular}{ll} 
model & a MxModel object. \\
indep & assign parameters to independent submodels.
\end{tabular}

\section*{See Also}
omxGetParameters, omxSetParameters

\section*{Examples}
```

A <- mxMatrix('Full', 3, 3, values = c(1:9), labels = c('a','b', NA),
free = TRUE, name = 'A')
model <- mxModel(model=A, name = 'model')
model <- omxAssignFirstParameters(model)

# Note: All cells with the same label now have the same start value.

# Note also that NAs are untouched.

\# [2,] 202
\# [3, ] 3 6 9
omxBrownie Make Brownies in OpenMx

\section*{Description}

This function returns a brownie recipe.

\section*{Usage}
omxBrownie(quantity=1, walnuts=TRUE)

\section*{Arguments}
quantity \(\quad\) Number of batches of brownies desired. Defaults to one.
walnuts Logical. Indicates whether walnuts are to be included in the brownies. Defaults to TRUE.

\section*{Details}

Returns a brownie recipe. Alter the 'quantity' variable to make more pans of brownies. Ingredients, equipment and procedure are listed, but neither ingredients nor equipment are provided.

\section*{Value}

Returns a brownie recipe.

\section*{References}

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

\section*{See Also}

More information about the OpenMx package may be found here.

\section*{Examples}
```

# Return a brownie recipe

omxBrownie()

```

\section*{Description}

This function tests whether two numeric vectors or matrixes are approximately equal to one another, within a specified threshold.

\section*{Usage}
omxCheckCloseEnough(a, b, epsilon \(=10^{\wedge}(-15)\), na.action \(=\) na.fail)

\section*{Arguments}
a
b
epsilon a non-negative tolerance threshold
na.action either na.fail (default) or na.pass. Use of na.omit or na.exclude is not recommended.

\section*{Details}

Arguments ' \(a\) ' and ' \(b\) ' must be of the same type, ie. they must be either vectors of equal dimension or matrices of equal dimension. The two arguments are compared element-wise for approximate equality. If the absolute value of the difference of any two values is greater than the threshold, then an error will be thrown. If ' \(a\) ' and ' \(b\) ' are approximately equal to each other, by default the function will print a statement informing the user the test has passed. To turn off these print statements use options("mxPrintUnitTests" = FALSE).

When na.action is set to na.pass, \(a\) and \(b\) are expected to have identical missingness patterns.

\section*{References}

\section*{Examples}
```

omxCheckCloseEnough(c(1, 2, 3), c(1.1, 1.9 ,3.0), epsilon = 0.5)
omxCheckCloseEnough(matrix(3, 3, 3), matrix(4, 3, 3), epsilon = 2)

# Throws an error

try(omxCheckCloseEnough(c(1, 2, 3), c(1.1, 1.9 ,3.0), epsilon = 0.01))

```
omxCheckEquals
```

omxCheckEquals Equality Testing Function

```

\section*{Description}

This function tests whether two objects are equal using the ' \(==\) ' operator.

\section*{Usage}
omxCheckEquals(a, b)

\section*{Arguments}
a
the first value to compare.
b the second value to compare.

\section*{Details}

Performs the ' \(==\) ' comparison on the two arguments. If the two arguments are not equal, then an error will be thrown. If ' \(a\) ' and ' \(b\) ' are equal to each other, by default the function will print a statement informing the user the test has passed. To turn off these print statements use options("mxPrintUnitTests" = FALSE).

\section*{References}

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

\section*{See Also}
omxCheckCloseEnough, omxCheckWithinPercentError, omxCheckSetEquals, omxCheckTrue, omxCheckIdentical

\section*{Examples}
```

omxCheckEquals(c(1, 2, 3), c(1, 2, 3))
omxCheckEquals(FALSE, FALSE)

# Throws an error

try(omxCheckEquals(c(1, 2, 3), c(2, 1, 3)))

```

\section*{Description}

This function tests whether the correct error message is thrown.

\section*{Usage}
omxCheckError (expression, message)

\section*{Arguments}
expression an \(R\) expression that produces an error
message a character string with the desired error message

\section*{Details}

Arguments 'expression' and 'message' give the expression that generates the error and the message that is supposed to be generated, respectively.

\section*{References}

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

\section*{See Also}
omxCheckWarning omxCheckWithinPercentError, omxCheckIdentical, omxCheckSetEquals, omxCheckTrue, omxCheckEquals

\section*{Examples}
```

A <- mxMatrix('Full', 1, 1, labels = 'data.foo', free = TRUE, name = 'A')
model <- mxModel('model', A)
omxCheckError(mxRun(model),
paste("The definition variable 'data.foo'",
"has been assigned to a",
"free parameter in matrix 'A'"))
omxCheckCloseEnough(matrix(3, 3, 3), matrix(4, 3, 3), epsilon = 2)

# Throws error, check the message

tmsg <- paste("In omxCheckCloseEnough(c(1, 2, 3), c(1.1, 1.9, 3), 0.01)",
": not equal to within 0.01 : '1 2 3' and '1.1 1.9 3'")
omxCheckError(omxCheckCloseEnough(c(1, 2, 3), c(1.1, 1.9 ,3.0), .01), tmsg)

```
```

omxCheckIdentical Exact Equality Testing Function

```

\section*{Description}

This function tests whether two objects are equal.

\section*{Usage}
omxCheckIdentical(a, b)

\section*{Arguments}
a
the first value to compare.
b the second value to compare.

\section*{Details}

Performs the 'identical' comparison on the two arguments. If the two arguments are not equal, then an error will be thrown. If ' \(a\) ' and ' \(b\) ' are equal to each other, by default the function will print a statement informing the user the test has passed. To turn off these print statements use options("mxPrintUnitTests" = FALSE).

\section*{References}

omxCheckIdentical(FALSE, FALSE)
\# Throws an error
try(omxCheckIdentical(c(1, 2, 3), c(2, 1, 3)))

```
```

omxCheckNamespace omxCheckNamespace

```

\section*{Description}

This is an internal function exported for those people who know what they are doing.

\section*{Usage}
omxCheckNamespace(model, namespace)

\section*{Arguments}
```

model model
namespace namespace

```

\section*{Details}

This function checks that the named entities in the model are valid.
```

omxCheckSetEquals Set Equality Testing Function

```

\section*{Description}

This function tests whether two vectors contain the same elements.

\section*{Usage}
omxCheckSetEquals(a, b)

\section*{Arguments}
a the first vector to compare.
b the second vector to compare.

\section*{Details}

Performs the 'setequal' function on the two arguments. If the two arguments do not contain the same elements, then an error will be thrown. If ' \(a\) ' and ' \(b\) ' contain the same elements, by default the function will print a statement informing the user the test has passed. To turn off these print statements use options("mxPrintUnitTests" = FALSE).

omxCheckSetEquals(matrix(1, 1, 1), matrix(1, 3, 3))

# Throws an error

try(omxCheckSetEquals(c(1, 2, 3, 4), c(2, 1, 3)))

```
    omxCheckTrue Boolean Equality Testing Function

\section*{Description}

This function tests whether an object is equal to TRUE.

\section*{Usage}
omxCheckTrue(a)

\section*{Arguments}
a the value to test.

\section*{Details}

Checks element-wise whether an object is equal to TRUE. If any of the elements are false, then an error will be thrown. If ' \(a\) ' is TRUE, by default the function will print a statement informing the user the test has passed. To turn off these print statements use options("mxPrintUnitTests" = FALSE).

\section*{References}

# Throws an error

try(omxCheckTrue(FALSE))

```
omxCheckWarning Correct Warning Message Function

\section*{Description}

This function tests whether the correct warning message is thrown.

\section*{Usage}
omxCheckWarning(expression, message)

\section*{Arguments}
expression an \(R\) expression that produces a warning
message a character string with the desired warning message

\section*{Details}

Arguments 'expression' and 'message' give the expression that generates the warning and the message that is supposed to be generated, respectively.

\section*{References}

"Please use mxExpectationNormal(covariance= , means = , ...) instead,",
"and add a call to mxFitFunctionML().",
"See examples at help(mxExpectationNormal)")
foo <- omxCheckWarning(mxFIMLObjective('cov', 'mean'), msg)

```
omxCheckWithinPercentError
Approximate Percent Equality Testing Function

\section*{Description}

This function tests whether two numeric vectors or matrixes are approximately equal to one another, within a specified percentage.

\section*{Usage}
omxCheckWithinPercentError (a, b, percent \(=0.1\) )

\section*{Arguments}
a
a numeric vector or matrix.
b a numeric vector or matrix.
percent a non-negative percentage.

\section*{Details}

Arguments ' \(a\) ' and ' \(b\) ' must be of the same type, ie. they must be either vectors of equal dimension or matrices of equal dimension. The two arguments are compared element-wise for approximate equality. If the absolute value of the difference of any two values is greater than the percentage difference of ' \(a\) ', then an error will be thrown. If ' \(a\) ' and ' \(b\) ' are approximately equal to each other, by default the function will print a statement informing the user the test has passed. To turn off these print statements use options("mxPrintUnitTests" = FALSE).

\section*{References}

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.

omxCheckWithinPercentError(c(1, 2, 3), c(1.1, 1.9 ,3.0), percent = 50)
omxCheckWithinPercentError(matrix(3, 3, 3), matrix(4, 3, 3), percent = 150)

# Throws an error

try(omxCheckWithinPercentError(c(1, 2, 3), c(1.1, 1.9 ,3.0), percent = 0.01))

```
omxConstrainMLThresholds
omxConstrainMLThresholds

\section*{Description}

Add constraint to ML model to keep thresholds in order

\section*{Usage}
omxConstrainMLThresholds(model, dist \(=0.1\) )

\section*{Arguments}
\[
\begin{array}{ll}
\text { model } & \text { the MxModel to which constraints should be added } \\
\text { dist } & \text { unused }
\end{array}
\]

\section*{Details}

This function adds a nonlinear constraint to an ML model. The constraint keeps the thresholds in order. Constraints often slow model estimation, however, keeping the thresholds in increasing order helps ensure the likelihood function is well-defined. If you're having problems with ordinal data, this is one of the things to try.

\section*{Value}
a new MxModel object with the constraints added

\section*{See Also}
```

    demo("omxConstrainMLThresholds")
    ```
```

omxDetectCores omxDetectCores

```

\section*{Description}

Detects the number of cores on the local machine

\section*{Usage}
omxDetectCores(...)

\section*{Arguments}
\[
\ldots \quad \text { unused }
\]
```

omxGetNPSOL omxGetNPSOL

```

\section*{Description}

Get the non-CRAN version of OpenMx from the OpenMx website.

\section*{Usage}
omxGetNPSOL()

\section*{Details}

This function

\section*{Value}

Invisible NULL

\section*{Examples}
\#\# Not run: omxGetNPSOL()
omxGetParameters Fetch Model Parameters

\section*{Description}

Return a vector of the chosen parameters from the model.

\section*{Usage}
omxGetParameters(model, indep \(=\) FALSE, free \(=c(T R U E, ~ F A L S E, N A)\), fetch = c('values', 'free', 'lbound', 'ubound', 'all'))

\section*{Arguments}
model a MxModel object
indep fetch parameters from independent submodels.
free fetch either free parameters (TRUE), or fixed parameters or both types. Default value is TRUE.
fetch which attribute of the parameters to fetch. Default choice is 'values'.

\section*{Details}

The argument 'free' dictates whether to return only free parameters or only fixed parameters or both free and fixed parameters. The function can return unlabelled free parameters (parameters with a label of NA). These anonymous free parameters will be identified as 'modelname.matrixname[row,col]'. It will not return fixed parameters that have a label of NA. No distinction is made between ordinary labels, definition variables, and square bracket constraints. The function will return either a vector of parameter values, or free/fixed designations, or lower bounds, or upper bounds, depending on the 'fetch' argument. Using fetch with 'all' returns a data frame that is populated with all of the attributes.

\section*{See Also}
omxSetParameters, omxLocateParameters, omxAssignFirstParameters

\section*{Examples}
```

library(OpenMx)
A <- mxMatrix('Full', 2, 2, labels = c("A11", "A12", "A21", NA), values= 1:4,
free = c(TRUE,TRUE,FALSE,TRUE), byrow=TRUE, name = 'A')
model <- mxModel(A, name = 'model')

# Request all free parameters in model

omxGetParameters(model)

# A11 A12 model.A[2,2]

# 1 2 4

# Request fixed parameters from model

omxGetParameters(model, free = FALSE)

# A21

# [1,] "A11" "A12"

# [2,] "A21" NA

# Example using un-labelled parameters

```
```

# Read in some demo data

data(demoOneFactor)

# Grab the names for manifestVars

manifestVars <- names(demoOneFactor)
nVar = length(manifestVars) \# 5 variables
factorModel <- mxModel("One Factor",
mxMatrix(name="A", type="Full", nrow=nVar, ncol=1, values=0.2, free=TRUE,
lbound = 0.0, labels=letters[1:nVar]),
mxMatrix(name="L", type="Symm", nrow=1, ncol=1, values=1, free=FALSE),
\# the "U" matrix has nVar (5) anonymous free parameters
mxMatrix(name="U", type="Diag", nrow=nVar, ncol=nVar, values=1, free=TRUE),
mxAlgebra(expression=A %\&% L + U, name="R"),
mxExpectationNormal(covariance="R", dimnames=manifestVars),
mxFitFunctionML(),
mxData(observed=cov(demoOneFactor), type="cov", numObs=500)
)

# Get all free parameters

params <- omxGetParameters(factorModel)
lbound <- omxGetParameters(factorModel, fetch="lbound")

# Set new values for these params, saving them in a new model

newFactorModel <- omxSetParameters(factorModel, names(params), values = 1:10)

# Read out the values from the new model

newParams <- omxGetParameters(newFactorModel)

```
omxGetRAMDepth omxGetRAMDepth

\section*{Description}

Get the potency of a matrix for inversion speed-up

\section*{Usage}
omxGetRAMDepth (A, maxdepth \(=\operatorname{nrow}(\mathrm{A})-1)\)

\section*{Arguments}
\(\begin{array}{ll}\text { A } & \text { MxMatrix object } \\ \text { maxdepth } & \text { Numeric. maximum depth to check }\end{array}\)

\section*{Details}

This function is used internally by the mxExpectationRAM function to determine how far to expand \((I-A)^{-1}=I+A+A^{2}+A^{3}+\ldots\). It is similarly used by mxExpectationLISREL in expanding \((I-B)^{-1}=I+B+B^{2}+B^{3}+\ldots\). In many situations \(A^{2}\) is a zero matrix (nilpotent of order 2 ). So when \(A\) has large dimension it is much faster to compute \(I+A\) than \((I-A)^{-1}\).

\section*{Description}

The function accepts a RAM style model and outputs a visual representation of the model in Graphviz format. The function will output either to a file or to the console. The recommended file extension for an output file is ".dot".

\section*{Usage}
omxGraphviz(model, dotFilename = "")

\section*{Arguments}
model An RAM-type model.
dotFilename The name of the output file. Use "" to write to console.

\section*{Value}

Invisibly returns a string containing the model description in graphviz format.

\section*{References}

The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documentation.
```

omxLapply On-Demand Parallel Lapply

```

\section*{Description}

If the snowfall library is loaded, then this function calls sfLapply. Otherwise it invokes lapply.

\section*{Usage}
omxLapply(x, fun, ...)

\section*{Arguments}
\(x \quad a \quad v e c t o r\) (atomic or list) or an expressions vector. Other objects (including classed objects) will be coerced by as. list.
fun the function to be applied to each element of \(x\).
... optional arguments to fun.

\section*{See Also}
```

omxApply,omxSapply

```

\section*{Examples}
```

x <- list(a = 1:10, beta = exp(-3:3), logic = c(TRUE,FALSE,FALSE,TRUE))

# compute the list mean for each list element

omxLapply(x,mean)

```
omxLocateParameters Summarize Model Parameters

\section*{Description}

Return a data.frame object summarizing the free parameters in the model.

\section*{Usage}
omxLocateParameters(model, labels = NULL, indep = FALSE)

\section*{Arguments}
\begin{tabular}{ll} 
model & a MxModel object \\
labels & optionally specify which free parameters to retrieve. \\
indep & fetch parameters from independent submodels.
\end{tabular}

\section*{Details}

Invoking the function with the default value for the 'labels' argument retrieves all the free parameters. The 'labels' argument can be used to select a subset of the free parameters. Note that 'NA' is a valid possible input to the 'labels' argument.

\section*{See Also}
omxGetParameters, omxSetParameters, omxAssignFirstParameters

\section*{Examples}
```

A <- mxMatrix('Full', 2, 2, labels = c("A11", "A12", NA, NA), values= 1:4,
free = TRUE, byrow = TRUE, name = 'A')
model <- mxModel(A, name = 'model')

# Request all free parameters in model

omxLocateParameters(model)

```
```

# Request free parameters "A11" and all NAs

```
omxLocateParameters(model, c("A11", NA))
```

omxLogical Logical mxAlgebra() operators

```

\section*{Description}
omxNot computes the unary negation of the values of a matrix. omxAnd computes the binary and of two matrices. omxOr computes the binary or of two matrices. omxGreaterThan computes a binary greater than of two matrices. omxLessThan computes the binary less than of two matrices. omxApproxEquals computes a binary equals within a specified epsilon of two matrices.

\section*{Usage}
```

omxNot (x)
omxAnd( $x, y$ )
omxOr (x, y)
omxGreaterThan(x, y)
omxLessThan(x, y)
omxApproxEquals(x, y, epsilon)

```

\section*{Arguments}
\(x \quad\) the first argument, the matrix which the logical operation will be applied to.
\(y\) the second argument, applicable to binary functions.
epsilon the third argument, specifies the error threshold for omxApproxEquals. Abs(x[i][j]\(y[i][j])\) must be less than epsilon[i][j].

\section*{Examples}
```

A <- mxMatrix(values = runif(25), nrow = 5, ncol = 5, name = 'A')
B <- mxMatrix(values = runif(25), nrow = 5, ncol = 5, name = 'B')
EPSILON <- mxMatrix(values = 0.04*1:25, nrow = 5, ncol = 5, name = "EPSILON")
model <- mxModel(A, B, EPSILON, name = 'model')
mxEval(omxNot(A), model)
mxEval(omxGreaterThan(A,B), model)
mxEval(omxLessThan(B,A), model)
mxEval(omxOr(omxNot(A),B), model)
mxEval(omxAnd(omxNot(B), A), model)
mxEval(omxApproxEquals(A,B, EPSILON), model)

```

\section*{Description}
omxCbind columnwise binding of two or more MxMatrices. omxRbind rowwise binding of two or more MxMatrices. omxTranspose transpose of MxMatrix.

\section*{Usage}
```

omxCbind(..., allowUnlabeled =
getOption("mxOptions")[["Allow Unlabeled"]],
dimnames = NA, name = NA)
omxRbind(..., allowUnlabeled =
getOption("mxOptions")[["Allow Unlabeled"]],
dimnames = NA, name = NA)
omxTranspose(matrix, allowUnlabeled =
getOption("mxOptions")[["Allow Unlabeled"]],
dimnames = NA, name = NA)

```

\section*{Arguments}
\begin{tabular}{ll}
\(\ldots\). & two or more MxMatrix objects \\
matrix & MxMatrix input
\end{tabular}
allowUnlabeled whether or not to accept free parameters with NA labels
dimnames list. The dimnames attribute for the matrix: a list of length 2 giving the row and column names respectively. An empty list is treated as NULL, and a list of length one as row names. The list can be named, and the list names will be used as names for the dimensions.
name an optional character string indicating the name of the MxMatrix object

\section*{omxMnor Multivariate Normal Integration}

\section*{Description}

Given a covariance matrix, a means vector, and vectors of lower and upper bounds, returns the multivariate normal integral across the space between bounds.

\section*{Usage}
omxMnor(covariance, means, lbound, ubound)

\section*{Arguments}
covariance the covariance matrix describing the multivariate normal distribution.
means a row vector containing means of the variables of the underlying distribution.
lbound a row vector containing the lower bounds of the integration in each variable.
ubound a row vector containing the upper bounds of the integration in each variable.

\section*{Details}

The order of columns in the 'means', 'lbound', and 'ubound' vectors are assumed to be the same as that of the covariance matrix. That is, means[i] is considered to be the mean of the variable whose variance is in covariance[i,i]. That variable will be integrated from lbound[i] to ubound[i] as part of the integration.
The value of ubound[i] or lbound[i] may be set to Inf or -Inf if a boundary at positive or negative infinity is desired.

For all i, ubound[i] must be strictly greater than lbound[i].

\section*{Examples}
```

data(myFADataRaw)
covariance <- cov(myFADataRaw[,1:3])
means <- colMeans(myFADataRaw[,1:3])
lbound <- c(-Inf, 0, 1) \# Integrate from -Infinity to 0 on first variable
ubound <- c(0, Inf, 2.5) \# From 0 to +Infinity on second, and from 1 to 2.5 on third
omxMnor(covariance, means, lbound, ubound)

# 0.0005995

# An alternative specification of the bounds follows

# Integrate from -Infinity to 0 on first variable

v1bound = c(-Inf, 0)

# From 0 to +Infinity on second

v2bound = c(0, Inf)

# and from 1 to 2.5 on third

v3bound = c(1, 2.5)
bounds <- cbind(v1bound, v2bound, v3bound)
lbound <- bounds[1,]
ubound <- bounds[2,]
omxMnor(covariance, means, lbound, ubound)

```
omxNameAnonymousParameters
omxNameAnonymousParameters

\section*{Description}

Assign new names to the unnamed parameters

\section*{Usage}
omxNameAnonymousParameters(model, indep = FALSE)

\section*{Arguments}
\begin{tabular}{ll} 
model & the MxModel \\
indep & whether models are independent
\end{tabular}

\section*{Value}
a list with components for the new MxModel with named parameters, and the new names.

\section*{Description}

Get quantiles from a normal distribution

\section*{Usage}
omxNormalQuantiles(nBreaks, mean = 0, sd = 1)

\section*{Arguments}
nBreaks the number of thresholds, or a vector of the number of thresholds
mean the mean of the underlying normal distribution
sd the standard deviation of the underlying normal distribution

\section*{Value}
a vector of quantiles

\section*{Examples}
```

omxNormalQuantiles(3)
omxNormalQuantiles(3, mean=7)
omxNormalQuantiles(2, mean=1, sd=3)

```
```

omxParallelCI omxParallelCI

```

\section*{Description}

Create parallel models for parallel confidence intervals

\section*{Usage}
omxParallelCI(model, run = TRUE)

\section*{Arguments}
model an MxModel with confidence intervals in it
run whether to run the model or just return the parallelized interval models

\section*{Value}
an MxModel object

\section*{Examples}
```

require(OpenMx)
data(demoOneFactor)
manifests <- names(demoOneFactor)
latents <- c("G")
factorModel <- mxModel("One Factor",
type="RAM",
manifestVars=manifests,
latentVars=latents,
mxPath(from=latents, to=manifests),
mxPath(from=manifests, arrows=2),
mxPath(from=latents, arrows=2, free=FALSE, values=1.0),
mxData(observed=cov(demoOneFactor), type="cov",
numObs=500),
\# add confidence intervals for free params in A and S matrices
mxCI(c('A', 'S')))
factorRun <- mxRun(factorModel)
factorCI <- omxParallelCI(factorRun) \# Run CIs in parallel

```
omxQuotes omxQuotes

\section*{Description}

Quote helper function, often for error messages.

\section*{Usage}
omxQuotes(name)

\section*{Arguments}

\section*{name a character vector}

\section*{Details}

This is a helper function for creating a nicely put together formatted string.

\section*{Value}
a character string

\section*{Examples}
omxQuotes(c("Oh", "blah", "dee", "Oh", "blah", "da"))
omxQuotes(c("A", "S", "F"))
omxQuotes("Hello World")
omxRAMtoML omxRAMtoML

\section*{Description}

Convert a RAM model to an ML model

\section*{Usage}
omxRAMtoML(model)

\section*{Arguments}
model the MxModel

\section*{Details}

This is a legacy function that was once used to convert RAM models to ML models in the old (1.0 release of OpenMx) objective function style.

\section*{Value}
an ML model with an ML objective
omxRMSEA Get the RMSEA with confidence intervals from model

\section*{Description}

This function calculates the Root Mean Square Error of the Approximation (RMSEA) for a model and computes confidence intervals for that fit statistic.

\section*{Usage}
omxRMSEA(model, lower=.025, upper=.975, null=.05, ...)

\section*{Arguments}
\begin{tabular}{ll} 
model & An MxModel object for which the RMSEA is desried \\
lower & The lower confidence bound for the confidence interval \\
upper & The upper confidence bound for the confidence interval \\
null & Value of RMSEA used to test for close fit \\
\(\ldots\) & Further named arguments passed to summary
\end{tabular}

\section*{Details}

To help users obtain fit statistics related to the RMSEA, this function confidence intervals and a test for close fit. The user determines how close the fit is required to be by setting the null argument to the value desired for comparison.

\section*{Value}

A named vector with elements lower, est.rmsea, upper, null, and ' \(\operatorname{Prob}(\mathrm{x}<=\) null)'.

\section*{References}

Browne, M. W. \& Cudeck, R. (1992). Alternative Ways of Assessing Model Fit. Sociological Methods and Research, 21, 230-258.

\section*{Examples}
```

require(OpenMx)
data(demoOneFactor)
manifests <- names(demoOneFactor)
latents <- c("G")
factorModel <- mxModel("One Factor",
type="RAM",
manifestVars=manifests,
latentVars=latents,
mxPath(from=latents, to=manifests),
mxPath(from=manifests, arrows=2),
mxPath(from=latents, arrows=2, free=FALSE, values=1.0),
mxData(observed=cov(demoOneFactor), type="cov", numObs=500))
factorRun <- mxRun(factorModel)
factorSat <- mxRefModels(factorRun, run=TRUE)
summary(factorRun, refModels=factorSat)

# Gives RMSEA with 95% confidence interval

omxRMSEA(factorRun, .05, .95, refModels=factorSat)

# Gives RMSEA with 90% confidence interval

# and probability of 'close enough' fit

```
omxSapply On-Demand Parallel Sapply

\section*{Description}

If the snowfall library is loaded, then this function calls sfSapply. Otherwise it invokes sapply.

\section*{Usage}
omxSapply(x, fun, ..., simplify = TRUE, USE.NAMES = TRUE)

\section*{Arguments}
\(x \quad a \quad\) vector (atomic or list) or an expressions vector. Other objects (including classed objects) will be coerced by as.list.
fun the function to be applied to each element of \(x\).
... optional arguments to fun.
simplify logical; should the result be simplified to a vector or matrix if possible?
USE.NAMES logical; if TRUE and if x is a character, use x as names for the result unless it had names already.

\section*{See Also}
omxApply, omxLapply

\section*{Examples}
```

x<- list(a = 1:10, beta = exp(-3:3), logic = c(TRUE,FALSE,FALSE,TRUE))

# compute the list mean for each list element

omxSapply(x, quantile)

```
omxSaturatedModel Create Reference (Saturated and Independence) Models

\section*{Description}

This function creates and optionally runs saturated and independence (null) models of a base model or data set for use with mxSummary to obtain more fit indices.

\section*{Usage \\ mxRefModels(x, run=FALSE)}

\section*{Arguments}
x run logical. If TRUE runs the models before returning; otherwise returns built models without running.

\section*{Details}

For typical structural equation models the saturated model is the free-est possible model. All covariances and, when possilbe, all means are estimated. In the case of ordinal data, the ordinal means are fixed to zero and the thresholds are estimated. When the ordinal data are binary, those variances are also constrained to one. This is the free-est possible model, only constrained for model identification. The saturated model is used to create the RMSEA, and Chi-squared fit indices.
The independence model, sometimes called the null model, is a model of each variable being completely independent of every other variable. As such, all the variances and, when possible, all means are estimated. However, covariances are set to zero. Ordinal variables are handled the same for the independence and saturated models. The independence model is used, along with the saturated model, to create CFI and TLI fit indices.
When the mxFitFunctionMultigroup fit function is used, mxRefModels creates the appropriate multigroup saturated and independence models. Saturated and independence models are created separately for each group. Each group has its own saturated and independence model. The multigroup saturated model is a multigroup model where each group has its own saturated model, and similarly for the independence model.

One potentially important limitation of the mxRefModels function is for behavioral genetics models. If variables ' \(x\) ', ' \(y\) ', and ' \(z\) ' are measured on twins 1 and 2 creating the modeled variables ' \(x l^{\prime}\), ' \(y 1\) ', ' z 1 ', ' x 2 ', ' y 2 ', ' z 2 ', then this function may not create the intended saturated or independence models. In particular, the means of 'x1' and 'x2' are estimated separately. Similarly, the covariance of
' x 1 ' with ' y 1 ' and ' x 2 ' with ' y 2 ' are allowed be be distinct: \(\operatorname{cov}(x 1, y 1)!=\operatorname{cov} x 2, y 2\). Moreover, the cross-twin covariances are estimated: e.g. \(\operatorname{cov}(x 1, y 2)!=0\).
Another potential misuse of this function is for models with definition variables. If definition variables are detect, a warning message is passed because the saturated and independence model may not be correct because they do not account for the definition variables.

When an MxModel has been run, some effort is made to make the reference models for only the variables used in the model. For covariance data, all variables are modeled by default. For raw data when the model has been run, only the modeled variables are used in the reference models. This matches the behavior of mxModel.

In general, it is best practice to give mxRefModels a model that has already been run.
For IFA models (mxExpectationBA81), the independence model preserves equality constraints among item parameters from the original model.

summary(factorRun, refModels=factorSat)

```
omxSelectRowsAndCols Filter rows and columns from an mxMatrix

\section*{Description}

This function filters rows and columns from a matrix using a single row or column R matrix as a selector.

\section*{Usage}
omxSelectRowsAndCols(x, selector)
omxSelectRows(x, selector)
omxSelectCols(x, selector)

\section*{Arguments}
x
the matrix to be filtered
selector A single row or single column \(R\) matrix indicating which values should be filtered from the mxMatrix.

\section*{Details}
omxSelectRowsAndCols, omxSelectRows, and omxSelectCols returns the filtered entries in a target matrix specified by a single row or single column selector matrix. Each entry in the selector matrix is treated as a logical data indicating if the corresponding entry in the target matrix should be excluded ( 0 or FALSE) or included (not 0 or TRUE). Typically the function is used to filter data from a target matrix using an existence vector which specifies what data entries are missing. This can be seen in the demo: RowObjectiveFIMLBivariateSaturated.

\section*{Value}

Returns a new matrix with the filtered data.

\section*{References}

The function is most often used when filtering data for missingness. This can be seen in the demo: RowObjectiveFIMLBivariateSaturated. The OpenMx User's guide can be found at http://openmx.psyc.virginia.edu/documen The omxSelect* functions share some similarity to the Extract function in the R programming language.

\section*{Examples}
```

loadings <- c(1, -0.625, 0.1953125, 1, -0.375, 0.0703125, 1, -0.375, 0.0703125)
loadings <- matrix(loadings, 3, 3, byrow= TRUE)
existenceList <- c(1, 0, 1)
existenceList <- matrix(existenceList, 1, 3, byrow= TRUE)
rowsAndCols <- omxSelectRowsAndCols(loadings, existenceList)
rows <- omxSelectRows(loadings, existenceList)
cols <- omxSelectCols(loadings, existenceList)

```
omxSetParameters Assign Model Parameters

\section*{Description}

Modify the attributes of parameters in a model. This function cannot modify parameters that have NA labels. Often you will want to call omxAssignFirstParameters after using this, to force the starting values of equated parameters to the same value (otherwise the model cannot begin to be evaluated)

\section*{Usage}
omxSetParameters(model, labels, free = NULL, values = NULL, newlabels \(=\) NULL, lbound \(=\) NULL, ubound \(=\) NULL, indep \(=\) FALSE, strict \(=\) TRUE, name \(=\) NULL)

\section*{Arguments}
model
labels a character vector of target parameter names.
free a boolean vector of parameter free/fixed designations.
values a numeric vector of parameter values.
newlabels a character vector of new parameter names.
lbound a numeric vector of lower bound values.
ubound a numeric vector of upper bound values.
indep boolean. set parameters in independent submodels.
strict boolean. If TRUE then throw an error when a label does not appear in the model.
name character string. (optional) a new name for the model.

\section*{See Also}
omxGetParameters, omxAssignFirstParameters

\section*{Examples}
```

    A <- mxMatrix('Full', 3, 3, labels = c('a','b', NA), free = TRUE, name = 'A')
    model <- mxModel(model="testModel", A, name = 'model')
    # set value of cells labelled "a" and "b" to 1 and 2 respectively
    model <- omxSetParameters(model, c('a', 'b'), values = c(1, 2))
    # set label of cell labelled "a" to "b" and vice versa
    model <- omxSetParameters(model, c('a', 'b'), newlabels = c('b', 'a'))
    # set label of cells labelled "a" to "b"
    model <- omxSetParameters(model, c('a'), newlabels = 'b')
    # ensure initial values are the same for each instance of a labeled parameter
    model <- omxAssignFirstParameters(model)
    ```
    omxSymbolTable Internal OpenMx algebra operations

\section*{Description}

This is an internal table used in the OpenMx backend.

OpenMx OpenMx: An package for Structural Equation Modeling and Matrix Algebra Optimization

\section*{Description}

OpenMx is a package for structural equation modeling, matrix algebra optimization and other statistical estimation problems. Try the example below. We try and have useful help files: for instance help(mxRun) to learn more. Also the reference manual

\section*{Details}

OpenMx solves algebra optimization and statistical estimation problems using matrix algebra. Most users use it for Structural equation modeling.
The core function is mxModel, which makes a model. Models are containers for data, matrices, mxPaths algebras, bounds and constraints. Models most often have an expectation function (e.g., mxExpectationNormal) to calculate the expectations for the model. Models need a fit function. Several of these are built-in (e.g., mxFitFunctionML ) OpenMx also allows user-defined fit functions for purposes not covered by the built-in functions. (e.g., mxFitFunctionR or mxFitFunctionAlgebra).

Once built, the resulting mxModel can be run (i.e., optimized) using mxRun. This returns the fitted model.

You can see the resulting parameter estimates, algebra evaluation etc using summary(yourModel)
The user's manual is online (see reference below), but functions mxRun, mxModel, mxMatrix all have working examples to get you started as well.

The main OpenMx functions are: mxAlgebra, mxBounds, mxCI, mxConstraint, mxData, mxMatrix, mxModel, and mxPath
Expectation functions include mxExpectationNormal, mxExpectationRAM, mxExpectationLISREL, and mxExpectationStateSpace;

Fit functions include mxFitFunctionML, mxFitFunctionAlgebra, mxFitFunctionRow and mxFitFunctionR.

OpenMx comes with several useful datasets built-in. Access them using data(package="OpenMx") To cite package 'OpenMx' in publications use:

manifests = names(demoOneFactor) \# manifest variables to be modeled

# ====================

# = Make the MxModel =

# ====================

m1 <- mxModel("One Factor", type = "RAM",
manifestVars = manifests, latentVars = latents,
mxPath(from = latents, to = manifests),
mxPath(from = manifests, arrows = 2),
mxPath(from = latents, arrows = 2, free = FALSE, values = 1.0),
mxData(cov(demoOneFactor), type = "cov", numObs = 500)
)

# ===============================

# = mxRun it and get a summary! =

# ===============================

m1 = mxRun(m1)
summary(m1, show = "std")

```
ordinalTwinData Data for ordinal twin model

\section*{Description}

Example data for ordinal twin-data modelling. Three variables measured in each twin.

\section*{Usage}
data("ordinalTwinData")

\section*{Format}

A data frame with 139 observations on the following 7 variables.
zyg a numeric vector
var1_twin1 a numeric vector
var2_twin1 a numeric vector
```

var3_twin1 a numeric vector
var1_twin2 a numeric vector
var2_twin2 a numeric vector
var3_twin2 a numeric vector

```

\section*{Examples}
```

data(ordinalTwinData)
str(ordinalTwinData)

```
rvectorize Vectorize By Row

\section*{Description}

This function returns the vectorization of an input matrix in a row by row traversal of the matrix. The output is returned as a column vector.

\section*{Usage}
```

    rvectorize(x)
    ```

\section*{Arguments}

X an input matrix.

\section*{See Also}
cvectorize, vech, vechs

\section*{Examples}
rvectorize(matrix(1:9, 3, 3))
rvectorize(matrix(1:12, 3, 4))
```

summary-MxModel Model Summary

```

\section*{Description}

This function returns summary statistics of a model after it has been run

\section*{Usage}
summary (object, ...)

\section*{Arguments}
object A MxModel object.
... Any number of named arguments (see below).

\section*{Details}
\(m x\) Summary allows the user to set or override the following parameters of the model:
numObs Numeric. Specify the total number of observations for the model.
numStats Numeric. Specify the total number of observed statistics for the model.
refModels List of MxModel objects. Specify a saturated and independence likelihoods in single argument for testing.

SaturatedLikelihood Numeric or MxModel object. Specify a saturated likelihood for testing.
SaturatedDoF Numeric. Specify the degrees of freedom of the saturated likelihood for testing.
IndependenceLikelihood Numeric or MxModel object. Specify an independence likelihood for testing.

IndependenceDoF Numeric. Specify the degrees of freedom of the independence likelihood for testing.
indep Logical. Set to FALSE to ignore independent submodels in summary.
verbose logical. Changes the printing style for summary (see Details)
The verbose argument changes the printing style for the summary of a model. When verbose=FALSE, a relatively minimal amount of information is printed: the free parameters, the likelihood, and a few fit indices. When more information is available, more is printed. For example, when the model has a saturated likelihood, several additional fit indices are printed. On the other hand, when verbose=TRUE, the compute plan, the data summary, and additional timing information are always printed. Moreover, available fit indices are printed regarless of whether or not they are defined. The undefined fit indices are printed as NA. Running a saturated model and including it with the call to summary will define these fit indices and they will dislay meaningful values. It should be noted that the verbose argument only changes the printing style, all of the same information is calculated and exists in the output of summary. More information is displayed when verbose=TRUE, and less when verbose=FALSE.

The Information Criteria (AIC, BIC) are reported in a table. The table shows different versions of the information criteria. Each entry in the table is an AIC or BIC obtained using different penalties. In particular, the entries of the table do not show different penalties, but rather different versions of AIC and BIC. For example the AIC is reported with both a Parameters Penalty and a Degrees of Freedom Penalty. AIC generally takes the form \(-2 L L+2 * k\). With the Parameters Penalty \(k\) is the number of free parameters. With the Degrees of Freedom Penalty, \(k\) is the model degrees of freedom. BIC is defined similarly: \(-2 L L+k * \log (N)\) where \(k\) is either the number of free parameters or the degrees of freedom. The Sample-Size Adjusted BIC is only defined for the parameters penalty: \(-2 L L+k * \log ((N+2) / 24)\).

The refModels, SaturatedLikelihood, SaturatedDoF, IndependenceLikelihood, and IndependenceDoF arguments can be used to obtain further fit statistics (RMSEA, CFI, TLI, Chi-Squared). For covariance data, saturated and independence models are fitted automatically so all fit indices are reported. For raw data, these reference models are not estimated to save computational time. For an easy way to make reference models for most cases is provided by the mxRefModels function. When the SaturatedLikelihood or IndependenceLikelihood arguments are used, the appropriate degrees of freedom are attempted to be calculated by OpenMx. However, depending on the model, it may sometimes behoove the user to also explicity provide the corresponding SaturatedDoF and/or IndependenceDoF. Again, for the vast majority of cases, the mxRefModels function handles these situations effectively and convenietly.

The summary function can report Error codes as follows:
- 1: The final iterate satisfies the optimality conditions to the accuracy requested, but the sequence of iterates has not yet converged. NPSOL was terminated because no further improvement could be made in the merit function (Mx status GREEN)
- 2: The linear constraints and bounds could not be satisfied. The problem has no feasible solution.
- 3: The nonlinear constraints and bounds could not be satisfied. The problem may have no feasible solution.
- 4: The major iteration limit was reached (Mx status BLUE).
- 6: The model does not satisfy the first-order optimality conditions to the required accuracy, and no improved point for the merit function could be found during the final linesearch (Mx status RED)
- 7: The function derivates returned by funcon or funobj appear to be incorrect.
- 9: An input parameter was invalid

For many raw data models, OpenMx does not automatically report the absolute fit indices (ChiSquared, CFI, TLI, and RMSEA). They are available once you fit reference models. See the example given in mxRefModels.
OpenMx does not recommend using some fit indices. These are GFI, AGFI, NFI, and SRMR. The Goodness of Fit Index (GFI) and Adjusted Goodness of Fit Index (AGFI) are not recommended because they are strongly influeced by sample size and have rather high Type I error rates (Sharma, Mukherjee, Kumar, \& Dillon, 2005). The Normed Fit Index (NFI) has no penalty for model complexity. That is, adding more parameters to a model always improves the NFI, regardless of how useful those parameters are. Because the Non-Normed Fit Index (NNFI), also known as the TuckerLewis Index (TLI), does adjust for model complexity it is used instead. Lastly, the Standardized

Root Mean Square Residual (SRMR) is not reported because it (1) only applies to covariance models, having no direct extension to missing data, (2) has no penalty for model complexity, similar to the NFI, and (3) is positively biased (Hu \& Bentler, 1999).

\section*{Examples}
```

library(OpenMx)
data(demoOneFactor) \# load the demoOneFactor dataframe
manifests <- names(demoOneFactor) \# set the manifest to the 5 demo variables
latents <- c("G") \# define 1 latent variable
model <- mxModel(model="One Factor", type="RAM",
manifestVars = manifests,
latentVars = latents,
mxPath(from = latents, to=manifests, labels = paste("b", 1:5, sep = "")),
mxPath(from = manifests, arrows = 2, labels = paste("u", 1:5, sep = "")),
mxPath(from = latents, arrows = 2, free = FALSE, values = 1.0),
mxData(cov(demoOneFactor), type = "cov", numObs = 500)
)
model <- mxRun(model) \# Run the model, returning the result into model

# Show summary of the fitted model

summary(model)

# Compute the summary and store in the variable "statistics"

statistics <- summary(model)

# Access components of the summary

statistics$parameters
statistics$SaturatedLikelihood

# Specify a saturated likelihood for testing

summary(model, SaturatedLikelihood = -3000)

# Add a CI and view it in the summary

model = mxRun(mxModel(model=model, mxCI("b5")), intervals = TRUE)
summary(model)

```
```

    tr trace
    ```

\section*{Description}

This function returns the trace of an n-by-n square matrix \(x\), defined to be the sum of the elements on the main diagonal (the diagonal from the upper left to the lower right).

\section*{Usage}
\(\operatorname{tr}(x)\)

\section*{Arguments}
x
an input matrix. Must be square

\section*{Details}

The input matrix must be square.

\section*{See Also}
vech, rvectorize, cvectorize

\section*{Examples}
```

tr(matrix(1:9, 3, 3))
tr(matrix(1:12, 3, 4))

```
twinData Australian twin sample biometric data.

\section*{Description}

Australian twin data with 3808 observations on the 12 variables including body mass index (BMI) assessed in both MZ and DZ twins.
Questionnaires were mailed to 5967 pairs age 18 years and over. These data consist of completed questionnaires returned by both members of 3808 ( 64 percent) pairs. There are two cohort blocks in the data: a younger group (zyg 1:5), and an older group (zyg 6:10)
It is a wide dataset, with two individuals per line. Data include zygosity (zyg), along with heights in metres, weights in kg , and the derived variables BMI in \(\mathrm{kg} / \mathrm{m} \wedge 2\) (stored as "htwt1" and "htwt2"), as well as the log of this variable, stored here as bm1 and bm2. The logged values are more closely normally distributed.
fam is a family identifier. Age is entered only once, as the both twins in each pair share a common age.
fam a numeric vector
age a numeric vector
zyg a numeric vector
part a numeric vector
wt1 a numeric vector
wt2 a numeric vector
ht1 a numeric vector
ht2 a numeric vector
htwt1 a numeric vector
htwt2 a numeric vector
bmi1 a numeric vector
bmi2 a numeric vector

\section*{Usage}
data(twinData)

\section*{Format}

A data frame with 3808 observations on the following 12 variables.
fam a numeric vectorof family IDs
age a numeric vectorof ages (years)
zyg a numeric vectorof zygosity (see below for important details)
part a numeric vector
wt1 a numeric vectorof weights in kg (twin 1)
wt2 a numeric vectorof weights in kg (twin 2)
ht1 a numeric vectorof heights in kg (twin 1)
ht2 a numeric vectorof heights in kg (twin 2)
htwt1 a numeric vectorof \(\mathrm{kg} / \mathrm{m}^{\wedge} 2\) twin 1
htwt2 a numeric vectorof \(\mathrm{kg} / \mathrm{m}^{\wedge} 2\) twin 2
bmi1 a numeric vectorof \(\log\) BMI for twin 1
bmi2 a numeric vectorof \(\log\) BMI for twin 2

\section*{Details}

Zygosity is coded as follows \(1==\) MZFF (i.e MZ females) \(2==\) MZMM (i.e MZ males) \(3==\) DZFF \(4==\) DZMM 5 == DZOS opposite sex pairs
Note: Zygosity 6:10 is the same, for an older cohort in the sample. So: \(6==\) MZFF (i.e MZ females) \(7==\) MZMM (i.e MZ males) \(8==\) DZFF \(9==\) DZMM \(10==\) DZOS opposite sex pairs

\section*{Examples}
```

data(twinData)
str(twinData)
plot(wt1 ~ wt2, data = twinData)
mzData <- as.matrix(subset(myTwinData, zyg == 1, c(bmi1, bmi2)))
dzData <- as.matrix(subset(myTwinData, zyg == 3, c(bmi1, bmi2)))

```
```

    twin_NA_dot Twin data on weight and height
    ```

\section*{Description}

Data set used in some of OpenMx's examples.

\section*{Usage}
data("twin_NA_dot")

\section*{Format}

A data frame with 3808 observations on the following variables.
fam Family ID variable
age Age of the twin pair. Range: 17 to 88.
zyg Integer codes for zygosity and gender combinations
part
wt1 Weight in kilograms for twin 1
wt2 Weight in kilograms for twin 2
ht1 Height in meters for twin 1
ht2 Height in meters for twin 2
htwt1 Product of ht and wt for twin 1
htwt2 Product of ht and wt for twin 2
bmi 1 Body Mass Index for twin 1
bmi2 Body Mass Index for twin 2

\section*{Details}

Same as myTwinData but has . as the missing data value instead of NA.

\section*{Source}

Timothy Bates

```
vec2diag Create Diagonal Matrix From Vector

\section*{Description}

Given an input row or column vector, vec2diag returns a diagonal matrix with the input argument along the diagonal.

\section*{Usage}
\(\operatorname{vec} 2 \operatorname{diag}(x)\)

\section*{Arguments}
\(x \quad\) a row or column vector.

\section*{Details}

Similar to the function diag, except that the input argument is always treated as a vector of elements to place along the diagonal.

\section*{See Also}
diag2vec

\section*{Examples}
```

vec2diag(matrix(1:4, 1, 4))
vec2diag(matrix(1:4, 4, 1))

```
vech Half-vectorization

\section*{Description}

This function returns the half-vectorization of an input matrix as a column vector.

\section*{Usage}
\(\operatorname{vech}(x)\)

\section*{Arguments}
\(x \quad\) an input matrix.

\section*{Details}

The half-vectorization of an input matrix consists of the elements in the lower triangle of the matrix, including the elements along the diagonal of the matrix, as a column vector. The column vector is created by traversing the matrix in column-major order.

\section*{See Also}
vech2full, vechs, rvectorize, cvectorize

\section*{Examples}
```

vech(matrix(1:9, 3, 3))
vech(matrix(1:12, 3, 4))

```
    vech2full Inverse Half-vectorization

\section*{Description}

This function returns the symmetric matrix constructed from a half-vectorization.

\section*{Usage}
vech2full( x )

\section*{Arguments}

\section*{Details}

The half-vectorization of an input matrix consists of the elements in the lower triangle of the matrix, including the elements along the diagonal of the matrix, as a column vector. The column vector is created by traversing the matrix in column-major order. The inverse half-vectorization takes a vector and reconstructs a symmetric matrix such that vech2full (vech(x)) is identical to \(x\) if \(x\) is symmetric.
Note that very few vectors have the correct number of elements to construct a symmetric matrix. For example, vectors with \(1,3,6,10\), and 15 elements can be used to make a symmetric matrix, but none of the other numbers between 1 and 15 can. An error is thrown if the number of elements in \(x\) cannot be used to make a symmetric matrix.

\section*{See Also}
vechs2full, vech, vechs, rvectorize, cvectorize

\section*{Examples}
```

vech2full(1:10)
matrix(1:16, 4, 4)
vech(matrix(1:16, 4, 4))
vech2full(vech(matrix(1:16, 4, 4)))

```
vechs Strict Half-vectorization

\section*{Description}

This function returns the strict half-vectorization of an input matrix as a column vector.

\section*{Usage}
vechs( x )

\section*{Arguments}
x
an input matrix.

\section*{Details}

The half-vectorization of an input matrix consists of the elements in the lower triangle of the matrix, excluding the elements along the diagonal of the matrix, as a column vector. The column vector is created by traversing the matrix in column-major order.

\section*{See Also}
```

vech, rvectorize, cvectorize

```

\section*{Examples}
```

vechs(matrix(1:9, 3, 3))
vechs(matrix(1:12, 3, 4))

```
    vechs2full Inverse Strict Half-vectorization

\section*{Description}

This function returns the symmetric matrix constructed from a strict half-vectorization.

\section*{Usage}
vechs2full(x)

\section*{Arguments}

X
an input single column or single row matrix.

\section*{Details}

The strict half-vectorization of an input matrix consists of the elements in the lower triangle of the matrix, excluding the elements along the diagonal of the matrix, as a column vector. The column vector is created by traversing the matrix in column-major order. The inverse strict halfvectorization takes a vector and reconstructs a symmetric matrix such that vechs2full (vechs(x)) is equal to x with zero along the diagonal if x is symmetric.

Note that very few vectors have the correct number of elements to construct a symmetric matrix. For example, vectors with \(1,3,6,10\), and 15 elements can be used to make a symmetric matrix, but none of the other numbers between 1 and 15 can. An error is thrown if the number of elements in \(x\) cannot be used to make a symmetric matrix.

\section*{See Also}
vech2full, vech, vechs, rvectorize, cvectorize
vechs2full

\section*{Examples}
```

vechs2full(1:10)
matrix(1:16, 4, 4)
vechs(matrix(1:16, 4, 4))
vechs2full(vechs(matrix(1:16, 4, 4)))
